Annual Saltman Lecture:
Further Beyond Reason: Emotions, the Core Concerns,
and Mindfulness in Negotiation.*

* Copyright © 2010 Leonard L. Riskin. Please send any comments to riskinL@law.ufl.edu.

This Article is an extended version of the 2009 Annual Saltman lecture, delivered at the University of Nevada-Las Vegas School of Law, Saltman Center for Conflict Resolution, on March 27, 2009. Since 2005, Dan Shapiro and I have regularly co-taught negotiation training workshops in which we have integrated what we call “tools of awareness” (primarily mindfulness) with the basic ideas about negotiation set forth in Roger Fisher & Daniel Shapiro, Beyond Reason: Using Emotions as You Negotiate (2005). I have learned a great deal from working with Dan, whose insights, wisdom, and enthusiasm have had a major impact on me and my work. I am also grateful to Jennifer Morrow, of Northwestern University’s School of Continuing Studies and ADR Systems, who first proposed this training collaboration and who has helped us greatly in offering Negotiation Institutes. Her ideas also appear in this Article, even if I can no longer trace them. This article has benefitted immeasurably from my extensive recent collaboration with Rachel Wohl, with whom I have taught several versions of a workshop on mindfulness for conflict resolvers, into which we have incorporated the Core Concerns System developed by Fisher and Shapiro. Some months ago, I prepared a brief essay on awareness and ethics. Leonard L. Riskin, Awareness and Ethics in Dispute Resolution and Law: Why Mindfulness Tends to Foster Ethical Behavior, 50 So. Tex. L. Rev. 493 (2009). As that essay was based on a symposium luncheon address, it was necessarily superficial; in it, however, I promised a more extensive consideration of the subject in the future. I thought this Article would fulfill that promise, but it does not. Once I began writing, I realized that I had my hands full addressing the interactions between the Core Concerns System and mindfulness. In future writing, I still hope to explore the potential effect of this interaction upon the ethical dimension of law and dispute resolution practice.

I do not, however, mean to suggest that the rest of this Article is deep or in any way authoritative. It is a preliminary exploration in which I have noted some possible mechanisms and outcomes of interactions involving negotiation, the Core Concerns System (and other approaches to negotiation), and mindfulness. Commentators in this Symposium in the Nevada Law Journal have already clarified and extended my thinking. I hope others will continue, as I will, to explore these interactions.

For their suggestions or their comments on earlier drafts of this Article or other closely related writings, I thank James Austin, Melissa Blacker, Daniel Bowling, Jonathan Cohen, Stuart Cohn, Mark Fenster, Catherine Damme, Clark Freshman, Jeffrey Harrison, Jack Himmelstein, Peter Huang, Ran Kuttner, Lea Johnston, Juan Perea, Don Peters, Richard Reuben, Scott Rogers, Danny Sokol, Daniel Shapiro, Jean Sternlight, Charles Wiggins, and Rachel Wohl. I also thank faculty and students at the University Nevada-Las Vegas School of Law and the University of Florida Levin College of Law and faculty at St. John’s University School of Law for comments on presentations based on previous versions of this Article. Some essential ideas in this article crystallized as I prepared for a presentation for the Center for Spirituality in Medicine at the University of Florida College of Medicine; thanks to the Center’s director, Dr. Lou Ritz, for inviting me. I learned a great deal from extensive conversations about meditation and the brain with James H. Austin, M.D., whose knowledge, wisdom, and patience I greatly appreciate. Many thanks to Eduardo Mordujojovich, J.D. 2009, University of Florida, for excellent research assistance and editorial suggestions, and to Edward Hart and his colleagues in the U. F. Legal Information Center, for getting mountains of materials for me. I am also grateful for the financial assistance of the Summer Research Grant Program at the University of Florida Levin College of Law. Special thanks to Michael and Sonja Saltman for funding this lecture series, to Jean Sternlight for inviting me to give the Saltman Lecture, and to the editors of the Nevada Law Journal, who helped me coax this into final form. And I could not be more grateful to friends and

Introduction

In 1995, President Bill Clinton and a number of American dignitaries traveled to and from Israel on Air Force One to attend the funeral of Israel’s Prime Minister, Itzak Rabin. Newt Gingrich, then Speaker of the U.S. House of Representatives, was on board and hoped to use the long flights to negotiate the budget with President Clinton. According to President Clinton’s spokesperson, however, he “just didn’t feel like negotiating the budget with the Speaker” after a long day hosting former presidents, secretaries of state, and congressional leaders. Nonetheless, Gingrich felt offended by Clinton’s unwillingness to negotiate. To make matters worse, when the plane landed at Andrews Air Force Base, Gingrich had to exit through the rear door, rather than joining the President and others who left through the forward door. In reaction to Clinton’s behavior, Gingrich admitted, he deliberately added provisions to a spending bill that he knew would prompt a presidential veto and precipitate a “shutdown” of the government. “This is petty, but I think it is human,” Gingrich explained. “You just wonder: Where is their sense of manners? Where’s their sense of courtesy?” Newt Gingrich has plenty of company in succumbing to strong negative emotions in situations of conflict, including some Democratic politicians who openly ridiculed his behavior. Although this happens to

4 id.
virtually everyone on occasion, most of us fail to openly acknowledge such failures. And even if we ignore or suppress strong negative emotions, they often affect our negotiation behavior in unproductive ways.

In the last three decades, numerous books and articles have proposed methods for getting beneath the surface in a negotiation, e.g. by uncovering motives and other causes that could account for the conflict or explain attempts to resolve it. Generally, this literature emphasizes the parties' interests in a negotiation, rather than their positions. A position is what the party says it wants or is entitled to have; an interest or need is the underlying goal or motive that propels the party to assert its position. Getting to Yes, first published in 1981, popularized this notion of focusing on underlying interests. Since then, many writers have refined or elaborated upon it, and others have extended it through a series of newer constructs. For example, Doug Stone, Bruce Patton, and Sheila Heen, propose considering every conversation as if it were three conversations (The What Happened? Conversation, the Feelings Conversation, and the Identity Conversation). Bernard Mayer adds another perspective, suggesting that we view conflict as if it had three

7 See ROGER FISHER & WILLIAM URY, GETTING TO YES: NEGOTIATING AGREEMENT WITHOUT GIVING IN 11 (1981); FISHER ET AL., GETTING TO YES, supra note 5, at 40-55.

8 See e.g., DAVID A. LAX & JAMES K. SEBENIUS, THE MANAGER AS NEGOTIATOR: BARGAINING FOR COOPERATION AND COMPETITIVE GAIN passim (1986); WILLIAM URY, GETTING PAST NO: NEGOTIATING WITH DIFFICULT PEOPLE passim (1991).

9 DOUGLAS STONE ET AL., DIFFICULT CONVERSATIONS: HOW TO DISCUSS WHAT MATTERS MOST 7-8 (1999) [hereinafter Stone et al.,].
dimensions—emotional, cognitive, and behavioral—and that full resolution requires resolution along all three dimensions.\(^\text{10}\)

In 2005, Roger Fisher and Daniel Shapiro published *Beyond Reason: Using Emotions as You Negotiate*, in which they describe how negative emotions can impede interest-based negotiation and how positive emotions can foster it.\(^\text{11}\) They assert that, in a negotiation there often are too many emotions at work for most people to attend to and address them directly.\(^\text{12}\) So they propose a method for dealing with emotions in negotiation indirectly, through attention to five “core concerns”—appreciation, affiliation, autonomy, status, and role—which they assert all people share.\(^\text{13}\) Left unfulfilled, these core concerns can precipitate negative emotions.\(^\text{14}\) For instance, on Air Force One, all of Speaker Gingrich’s core concerns took hits,\(^\text{15}\) and this produced negative feelings and hostile behavior.

Conversely, satisfaction of the core concerns leads to positive emotions. Fisher and Shapiro suggest that we use the core concerns in negotiations as a “lens” to diagnose some of the emotional aspects of the situation and as a “lever” to produce positive emotions, which can foster and enhance interest-based negotiation.\(^\text{16}\)

---

\(^{12}\) Id. at 12-14.

\(^{13}\) Id. at 15-18.

\(^{14}\) In constructing the Core Concerns System, Fisher and Shapiro drew upon a great deal of empirical research. See id. at 218-29.

\(^{15}\) To simplify, I assume that Gingrich thought that, by refusing to negotiate the budget with him, President Clinton failed to *appreciate* Gingrich’s pressing need to negotiate the budget, to foster his *autonomy*, or provide him a fitting *role*. The requirement that he leave through the rear door probably impinged on Gingrich’s concerns for *affiliation* (with the President and other leaders) and *status*.

\(^{16}\) Interest-based negotiation refers to negotiations that focus more on the parties’ interests (i.e., their motives or goals) than on their positions (i.e., claims or demands). See Fisher et al., *Getting to Yes*, supra note 5, at 40-55; Menkel-Meadow, *The Structure of Problem-Solving*, supra note 5, at 801-04.
I call this the “Core Concerns System”\textsuperscript{17}, and I have found it extremely useful,\textsuperscript{18} not only in negotiation, but in virtually any kind of human interaction. In this Article, I focus on one particularly common problem: Sometimes people who understand the Core Concerns System, know how to use it, and intend to employ it in a particular negotiation, either fail to do so or fail to do so skillfully; when they review the negotiation, they regret not having used the Core Concerns System, and believe that using it would have produced a better process and outcome. When this occurs, it often results from deficits or faults in the negotiator’s awareness.

It follows—and this is my principal proposal—that a negotiator can enhance his ability to employ the Core Concerns System through improving his awareness skills. I focus on one good way to do this: a method of present-moment, non-judgmental awareness, commonly known as mindfulness. A person cultivates the ability to be mindful principally through forms of meditation that have been developed most extensively by followers of Buddhist philosophy and psychology, and which are now commonly employed in the West—in health care, psychology, business, athletics, law practice, and legal education.\textsuperscript{19} These forms of meditation also have become a focus of neuroscientific and other research.\textsuperscript{20} I also will suggest that there is great potential for synergy—or mutual reinforcement—between mindfulness and the Core Concerns System:

\textsuperscript{17} Dan Shapiro calls it the “Core Concerns Framework.” See Daniel Shapiro, From Signal to Semantic: Uncovering the Emotional Dimension of Negotiation, 10 Nevada L.J.\_\_\_\_\_\_\_\_ (2010) [Hereinafter, Shapiro, \textit{Semantic}].

\textsuperscript{18} I generally agree with Professor George Box’s statement that “[a]ll models are wrong. Some are useful.” G.E.P. Box, \textit{Robustness in the Strategy of Scientific Model Building}, in \textit{Robustness in Statistics} 201, 202 (Robert L. Launer & Graham N. Wilkinson eds., 1979).

\textsuperscript{19} \textit{See infra} Part IV.A.

\textsuperscript{20} \textit{See infra} notes 113-24, 133, 136-37, 142-43, 154, 156, 159 and accompanying text.
Mindfulness can help people use the Core Concerns System; and knowledge of the Core Concerns System can enhance the practice of mindfulness.

I need to emphasize one more point: Much of what I say about the relationship between mindfulness and the Core Concerns System applies equally to the relationship between mindfulness and other systematic approaches to conflict resolution, especially those designed to get beneath the surface, such as interest-based negotiation, and mediation models that attempt to promote a broad understanding of “the problem.” Mindfulness and these other approaches can mutually reinforce each other. Thus, the Core Concerns System appears in this Article both as a representative of the family of interest-based approaches to conflict and as a method for fostering such approaches.

Here is the plan: Part I describes how negative emotions can impede skillful negotiation. Part II explains the Core Concerns System and how it can help negotiators to identify some causes of negative emotions and promote positive emotions and thereby foster interest-based negotiations. Part III identifies a series of obstacles to effectively using the Core Concerns System. Part IV explains mindfulness and related tools of awareness and suggests how they can help overcome the obstacles to using the Core Concerns System. Part V explains the potential for reciprocity—how knowledge of the Core Concerns System can enhance a negotiator’s mindfulness. The conclusion crystallizes the main points and endeavors to put them into a broader context.

I. The Problem: Emotions in Negotiation

---

Most of us have trouble dealing with emotions that are associated with conflict. Negotiators—especially those trained in law—commonly address this problem by trying to exclude emotions from negotiation and to focus solely on so-called objective, rational factors, such as money. Negotiators may come to this approach through mentoring, training, or education. Most traditional law school courses, for instance, exclude consideration of the emotions of the parties, lawyers, and judges. But many negotiators adopt this approach without any training, and without even thinking about it. Some of them have little or no conscious awareness of emotions. Others may ignore emotions in order to avoid uncomfortable anxiety. Still others might fear that recognizing, expressing, or attempting to address emotions will overwhelm their cognitive faculties and escalate the conflict, making it more difficult to resolve.

Speaking generally, Fisher and Shapiro assert that the Core Concerns System can promote better interest-based negotiation by addressing some causes of negative emotions and fostering positive emotions. I accept those premises, for purposes of this article—in part to keep it at a manageable length—even though the relationship between mood and

---

23 For a description of a person with this kind of limitation, see Daniel J. Siegel, The Mindful Brain: Reflection and Attunement in the Cultivation of Well-Being 300-04, 307-08 (2007) [hereinafter Siegel, Mindful Brain].

24 See Fisher & Shapiro, Beyond Reason, supra note 11, at 171-81.

Accordingly, when I discuss addressing emotions, I usually mean negative emotions. And I realize that, in particular circumstances, (1) categorizing a certain emotion as positive or negative may be problematic, and (2) negative emotions can provide a negotiator an advantage.

Although a negotiation that excludes direct expression or consideration of emotions often enables parties to settle disputes, it also can precipitate several problems. For instance, parties frequently will not reach the best feasible resolution because they fail to address their real interests or otherwise fail to look beneath their asserted positions.\footnote{See Fisher et al., *Getting to Yes*, supra note 5, passim; Menkel-Meadow, *The Structure of Problem-Solving*, supra note 5, passim.} As Bernard Mayer has suggested, “full” resolution of a conflict requires resolution along three dimensions—cognitive, emotional, and behavioral.\footnote{See Mayer, supra note 10, at 98.} And, as Daniel Shapiro argues elsewhere, “[e]motions are a means to communicate relational identity concerns.”\footnote{Daniel L. Shapiro, *Negotiating Emotions*, 20 CONFLICT RESOL. Q. 67, 68 (2002) [hereinafter Shapiro, *Negotiating Emotions*].} Thus, to the extent that negotiators keep emotions out of the negotiation process, they—or their principals—are less likely to achieve an emotional resolution because they do not address the needs associated with such emotions.\footnote{See Riskin & Welsh, supra note 21, at 877-94 (describing a particular case in which the professionals systematically ignored some of the plaintiff’s obvious core concerns).} Of course, emotions tend to sneak in anyway. When that happens, these emotions can prompt adversarial perspectives and behavior, making it less likely that the substantive interests will get attention. In addition, negative emotions can impair the parties’ ability to think clearly, render them vulnerable to
exploitation, and possibly harm relationships.\textsuperscript{30} Thus, negative emotions can even impair a negotiator’s ability to skillfully conduct adversarial negotiations.

The Gingrich-Clinton episode described at the beginning of this Article is just one high-profile example of negative emotions obstructing judgment. This can happen in more mundane situations, too. Consider this hypothetical:

Thirty years ago, Jack and Phil, now in their early 60s, left the employ of a boiler manufacturer for whom they worked as salesmen. They started their own firm, J-P Boilers (JPB), which would compete with their former employer. Phil was good at management and finance, while Jack excelled in sales. To facilitate management decisions (but, according to Jack, not to apportion control), they agreed to split the closely held stock unevenly, with Phil getting fifty-one percent, and Jack receiving forty-nine percent. Over the years, JPB has prospered. Phil has worked primarily in the office, and Jack has handled sales, spending much of his time on the road. Phil has remained physically fit, while Jack has done perhaps a bit too much entertaining and now enjoys noticeably less energy than he did a few years ago.

In recent years, their once-close relationship has deteriorated to the point that they avoid one another and communicate only by email—even when they are sitting in the same office. Two interrelated issues have produced much of the stress.

First, three years ago, Phil put his son Phil, Jr., a recent M.B.A. graduate of a prestigious school, in charge of Southeast sales, with Jack’s very reluctant acquiescence. This left Jack with Midwest sales (which has been the biggest portion of JPB’s business). Since that time, sales have accelerated greatly in the Southeast. Phil believes this is the result of Phil Jr.’s winning personality and his use of technology in marketing and sales. Phil contrasts these with Jack’s reliance on personal relationships with

\textsuperscript{30} See FISHER & SHAPIRO, BEYOND REASON, supra note 11, at 5-6.
customer representatives, and a good deal of time on the golf course and in the clubhouse bar. Jack, on the other hand, attributes the growth of sales in the Southeast to the exceptionally dynamic economy that region has enjoyed in the last three years.

The second issue is that Phil would like to give Phil, Jr. a more prominent role in the business, essentially putting him in charge of sales; at the same time, he would like to get rid of Jack, who Phil believes has not been pulling his weight. In litigation, this case would necessarily have a narrow problem definition. Each side would assert its claim as to what formal role Jack was entitled to play. Alternatively, either Jack or Phil might seek to dissolve the corporation. Their claims would rest on legal or equitable principles that they believe a court should recognize. In terms of negotiation theory, both Jack and Phil would be asserting “positions” (statements of what they want or are entitled to) in contrast to the real “interests” (the needs or goals that motivate them to assert these positions). A

---

31 This fact-pattern draws on role-play exercises developed and copyrighted by Michael Keating. J. Michael Keating, Jr., The Corporate Divorce Negotiation Role Play (1992) (on file with author). It is used with his permission.

32 I realize that Jack and Phil might be better off with lawyers or a mediator. But it is easier to explain the operation of the Core Concerns System using a simple one-on-one negotiation.

33 See Michael Moffitt, Pleadings in the Age of Settlement, 80 Ind. L.J. 727, 736-37 (2004). For an extensive discussion of the process of establishing the problem definition in a mediation, see Riskin & Welsh, supra note 16, at 904-09.

34 My colleague, Professor Stuart Cohn, has emphasized the severity of the problem Jack faces if he seeks to litigate. In order for him to bring a suit challenging the various steps being taken or considered by Phil, his most likely suit in most states which follow the Model Business Corporation Act (over 40) is a suit for dissolution (MBCA s. 14.30) based on "oppression," i.e. a failure to meet his reasonable expectations at the time he formed the corporation with Phil. Dissolution is a draconian remedy and obviously will roil the waters enormously, even though courts have the power to order a less intrusive remedy. But the mere filing of such a suit already will raise the dander level considerably. To make matters worse, in most Model Act states, once Jack files his lawsuit, he is subject to having his shares purchased involuntarily by the corporation or by Phil at "fair value," per MBCA s. 14.34. In other words, if Jack wants judicial relief, he seeks it at the risk of losing his shares.

E-mail from Stuart Cohn, Professor of Law, University of Florida Levin College of Law, to Leonard Riskin (June 23, 2009) (on file with author).
negotiation, however, can address both the parties’ positions and their underlying interests; by addressing party interests, it often is possible to use a process and secure an outcome that better serves the parties.\textsuperscript{35} I have used various versions of this scenario in teaching negotiation and mediation for years. When students or teachers attempt to identify the underlying interests, they come up with a list that looks something like this:

**Jack’s interests:**
- PJB’s continued prosperity;
- Health care or health insurance;
- Recognition of his contribution to PJB;
- Slowing down, traveling less, having more leisure time;
- Remaining active (possibly in the boiler business); Maintaining relationships with customers, many of whom have become friends;
- A satisfying role in the business;
- An enjoyable work atmosphere;
- (Possibly) improving his relationship with Phil.

**Phil’s Interests:**
- PJB’s continued prosperity;
- Recognition for his contribution to PJB;
- Continuing to work in the boiler business;
- Helping Phil Jr.;
- Establishing a significant role for Phil Jr.;
- Modernizing sales and marketing;
- (Possibly) improving his relationship with Jack;
- A satisfying role in the business;
- An enjoyable work atmosphere.\textsuperscript{36}

\textsuperscript{36} Using the core concerns framework, we could say that each also had “interests” based on the core concerns: Appreciation, Autonomy, Affiliation, Status, and Role. I think of the core concerns as psychological, identity-based interests. However, Daniel Shapiro, the co-creator of the Core Concerns Framework, is wary about using the terms interchangeably. He explains:

Some people have described the core concerns as core interests, and I think it could make sense. From my own perspective, however, the word "interests" calls forth a more emotional sense, whereas “interests” seems a bit more business-like/political in its historical use and nature. . . . An unmet concern . . . can be seen clearly to trigger an action tendency (and concomitant emotion). An interest (at least in terminology) seems to be a bit less intrinsically emotionally charged.

E-mail from Daniel Shapiro, Harvard Law School, to Leonard Riskin (June 10, 2007).
Through good, interest-based negotiation, Jack and Phil might be able to reach any number of agreements that would respond to most or all of these interests, and thus serve them collectively better than likely outcomes of judicial proceeding or a narrowly focused adversarial negotiation. To take one obvious example, they might decide that Jack would leave his current position with PJB but remain connected through a consulting or special employment arrangement under which he would retain some of his old clients, as well as his health insurance, and perhaps provide sales coaching for Phil, Jr. They might re-establish their cordial relations.

However, even if Jack and Phil knew about interest-based negotiation, they might fail to address underlying interests. Any number of barriers—behavioral, cognitive, and emotional—could impair their ability to negotiate in an interest-based fashion. The three kinds of barriers interact with one another, of course, but I will concentrate on emotional barriers.

Negative emotions permeate Jack and Phil’s relationship. For instance, Phil dislikes Jack because he believes that Jack stands in the way of modernizing the firm and of giving Phil, Jr. an appropriate role. He condemns Jack’s lifestyle, though he may also harbor a bit of envy. Moreover, Phil is frustrated in his desire to give Phil Jr. a bigger role in the business. On the other hand, Jack dislikes Phil for excluding him. He believes that Phil is selfishly motivated to promote Phil, Jr., and thus thinks that Phil is a bad person. Hence, each is angry with the other.

37 For discussions of behavioral, cognitive, and emotional barriers, see BARRIERS TO CONFLICT RESOLUTION (Kenneth Arrow et al. eds., 1995) [hereinafter, BARRIERS TO CONFLICT RESOLUTION]; Robert H. Mnookin, Why Negotiations Fail: An Exploration of Barriers to the Resolution of Conflict, 8 OHIO ST. J. ON DISP. RESOL. 235 (1993) hereinafter, Mnookin, Barriers].
Psychologists have documented the effects of mood on negotiation. Negotiators who are in a good mood, reach better, interest-based outcomes than those in a neutral mood. Positive emotions, it appears, promote good problem-solving, creativity, and empathy. A good mood may promote the release of dopamine, which can improve cognition. In sharp contrast, negative affect usually produces a negative impact on negotiation. In particular, negative emotions are associated with poor judgment and less concern about others, and can distract negotiators from attending to their real interests.

Thus, to the extent that negative emotions dominate their negotiation, Jack and Phil are more likely to wind up with a narrow definition of the problem, take adversarial positions, and pay relatively little attention to their underlying interests. They might, for instance, focus on the narrow issue of whether Jack should have an equal voice in management, and take strictly contrary positions; Phil would rely on legal arguments based on the corporate documents, while Jack would rely on the equities and his claim that the original purpose of apportioning stock was to facilitate management decisions. If they continue to conceptualize the problem narrowly (as would a court), they are likely to reach the same sort of outcome that a court would reach: that Jack either has or does not have an

38 Peter J.D. Carnevale & Alice M. Isen, *The Influence of Positive Affect and Visual Access on the Discovery of Integrative Solutions in Bilateral Negotiation*, 37 ORG’L BEHAV. & HUM. DECISION PROCESSES 1, 7-8 (1986); Freshman, *Mood Scientist, supra* note 19, at 19, 22. This is true even if the good mood was induced by the researchers. *Id.* at 15.
41 See Shapiro, *Negotiating Emotions, supra* note 28, at 70.
42 See Freshman, *Mood Scientist, supra* note 25 at 21-24; Shapiro, *Negotiating Emotions, supra* note 28, at 70. But see Clark Freshman, *Yes, and: Core Concerns, Internal Mindfulness, and External Mindfulness for Emotional Balance, Lie Detection, and Negotiation Success*, 10 Nevada L.J. ___ (2010) (“recent research has persuaded me that negative emotions such as anger may sometimes lead to better outcomes”) [hereinafter Freshman, *Yes, and.*]
43 Of course, they might also focus on whether Jack should leave the business or whether the business should be sold.
equal right to influence significant decisions. However, even with an agreement or court judgment recognizing such a right, successful implementation of the right could turn on whether they can recast their relationship. Of course, their level of anger and hostility may prevent them from doing so; that, of course, could lead back to could lead to PJB’s liquidation (judicial or otherwise), which would satisfy few of their interests, or continuation of the status quo, which both find unbearable.

II. Addressing the Challenge of Emotions in Negotiation: The Core Concerns System.\textsuperscript{44}

In a negotiation, Fisher and Shapiro tell us, everyone has five “core concerns”: affiliation, appreciation, autonomy, status, and role.\textsuperscript{45} We all want to feel the appreciation of others, to affiliate with others, to have autonomy, to have others recognize our status, and to have a meaningful role. We have these concerns not only in negotiation, but also in many interactions with others. Just imagine walking into a business or community organization meeting with a dozen people whom you do not know; passing a group of colleagues on their way out to a lunch to which you were not invited; going to the annual office holiday party; or attending your first class in law school. In any of these situations, each of the core concerns could manifest in varying degrees.

\textsuperscript{44} A number of approaches to interest-based conflict resolution suggest ways to address difficult emotions.\textsuperscript{44} See, e.g., Robert H. Mookin et al., Beyond Winning: Negotiating to Create Value in Deals and Disputes 200-201 (2000); Stone et al., supra note 9, at 85-107; Ury, Getting Past No, supra note 7, passim (1991); William Ury, The Power of a Positive No: Save the Deal, Save the Relationship—And Still Say No 33-42 (2007); Leigh L. Thompson, The Mind and Heart of the Negotiator 125 (4th ed. 2009).

I have chosen to focus on the core concerns framework developed by Roger Fisher and Daniel Shapiro (Fisher & Shapiro, Beyond Reason, supra note 11) for several reasons: (1) Dealing effectively with emotions is essential to skillfully carrying out any of the interest-based approaches to negotiation, (2) the Core Concerns System takes emotions as its central focus, (3) it is simple and, in my experience, extremely helpful, and (4) I am very familiar with the system.\textsuperscript{45} id. at 15-18.
Left unsatisfied, any of the core concerns can produce negative emotions. And negative emotions can interfere with good interest-based problem-solving. Satisfaction of these core concerns, however, leads to positive emotions, and positive emotions enhance one’s ability to engage skillfully in interest-based negotiation. Fisher and Shapiro believe that negotiators are influenced by too many emotions to notice and address directly, for that reason, they suggest that a more practical, robust approach is to deal with these emotions indirectly by employing the core concerns as a diagnostic “lens” (to understand the situation and to plan, conduct, and review the negotiation) and as a “lever” (to improve the situation by fostering positive emotions in all parties, which will make for a better interest-based negotiation). A negotiator uses the “lever” by expressing appreciation, building affiliation, respecting autonomy, acknowledging status, and choosing a fulfilling role.

I will illustrate using an emotion-laden piece of Jack and Phil’s negotiation.

Phil makes a proposal and immediately picks up the coffee carafe to fill the cup in front of Jack.

Jack responds: “No, Phil, I don’t want coffee, and I know exactly what you’re trying to pull. Man, I never met a more pompous, self-satisfied, arrogant jerk! I mean, really, why would you bother to actually learn anything about what I need to do—what

46 Fisher & Shapiro, Beyond Reason, supra note 11, at 15-16, passim. Fisher and Shapiro define emotion as: “An experience to matters of personal significance; typically experienced in association with a distinct type of physical feeling, thought, physiology, and action tendency.” Id. at 209. Scholars have defined emotion in many ways. See, e.g., Paul Ekman, All Emotions are Basic, in The Nature of Emotion 15 (Paul Ekman & Richard J. Davidson eds., 1994).

47 Fisher & Shapiro, Beyond Reason, supra note 11, at 18-21.

48 For a contrary view, see Freshman, Yes, and supra note 42, at 7-9.

49 In this Symposium, Shapiro has characterized this approach as one dealing with the “emotional dimension” of negotiation. See Shapiro, supra note 17 at

50 Fisher & Shapiro, Beyond Reason, supra note 11, at 18-21.

51 Id. at 25-142.
needs to be done for this company—‘cause you have it all figured out, don’t you? You’ve been watching too many Kevin Costner flicks, buddy, yeah, you build your spreadsheet and the customers come. After all this time, you have no idea what it takes to develop customers and really take care of them. You have no idea what I’ve been doing all these years. Without me, you’d be exactly where you belong.” Overcome with anger and other negative emotions, Phil responds with something like: “You’re a bum, a has-been, a never-was. You’ve been goofing off for years. I don’t ever want to see you again.”

Plainly, this interchange escalates negative emotions, which could lead either to termination of the negotiation or to very adversarial strategies and tactics that would miss opportunities for addressing underlying interests.

However, if Phil were able to use the Core Concerns System at this moment, events might unfold differently. Imagine that, before his negotiation with Jack, Phil reads *Beyond Reason* and takes a negotiation training program based on it. (This would mean that he has learned the basics of interest-based negotiation, in addition to the Core Concerns System.)

In brief, using the core concerns as a lens, Phil would realize that Jack’s anger and consequent nasty words resulted principally from Jack’s core concern for appreciation—the most fundamental of the core concerns. Phil also would realize that the negative thoughts and emotions that Jack’s statement precipitated in him derived from his own, similar core concern for appreciation—and likely from other core concerns as well.

Then, using the core concerns as a lever, he would seek to appreciate Jack, perhaps saying

---

52 Beyond Reason does not mention all of the ideas associated with interest-based negotiation. However, it does include the most comprehensive recent formulation of the idea produced by the Program on Negotiation at Harvard Law School—the Seven Elements of Negotiation: Relationship, Communication, Interests, Options, Legitimacy, BATNA (Best Alternative to a Negotiated Agreement) and Commitments. *FISHER & SHAPIRO, BEYOND REASON*, supra note 11, at 207-08.
something like: “Jack, would you be willing to help me understand what your life on the road, working for our firm, has been like?”

If Jack is willing to explain—and this is a big “if”—Phil might be able to appreciate Jack’s work and to express that appreciation. For instance, Phil might say, “I had no idea what challenges you’ve dealt with, and the personal costs you incurred. I think you have made a remarkable contribution to the company and I am very grateful to you.” As a result of such an interchange, both might experience an increase in positive emotions, which could foster their ability to do interest-based negotiation. Of course, as a tactical matter, Phil should make such comments—and they would be effective—only if they are genuine and if they are appropriate, given Jack and Phil’s long-standing relationship and the context of the moment.53

Here is a more detailed picture of how Phil might use the core concerns—as a lens and as a lever—in preparing for, conducting, and reviewing the negotiation.

A. As a lens, directed at Jack

Using the core concerns as a lens to understand Jack, Phil would review past events privately, or ask Jack questions. In so doing, Phil might realize that Jack:

- Thinks that Phil does not appreciate his contribution to PJB;
- Is concerned about his affiliation with Phil and with PJB;
- Feels a need for autonomy in decision-making about PJB and his relationship to it;
- Is concerned about his status in relation to Phil, Phil, Jr., and PJB; and
- Believes that he does not have a fulfilling or appropriate role in PJB

53 See Shapiro, *Semantic, supra* note 17 at ___.

Thus, Phil should be able to see that Jack’s core concerns were significant in the evolution of the conflict and would remain important to Jack during the negotiation.

Such understandings also might lead to further insights. For example, before he began to use the Core Concerns System, Phil believed that Jack had harmed PJB—e.g., by staying on the road too long, drinking too much, grasping for power, and opposing both modernization and the inclusion of Phil Jr. Furthermore, Phil believes that Jack’s behaviors are manifestations of his character flaws—his laziness, selfishness, rigidity and small-mindedness. These beliefs about Jack’s character precipitated or enhanced Phil’s disdain, anger, and resentment toward Jack.

If, however, Phil could direct the core concerns lens at Jack, he might learn that the elements of Jack’s behavior to which he objected grew out of Jack’s unsatisfied core concerns, rather than from his character. As shown above, Phil might see that Jack’s surly behavior springs from an unsatisfied concern for appreciation, and recognize that other core concerns likely induced Jack’s other negative behaviors. Jack’s concern for affiliation, for example, could have propelled him into social and drinking relationships with his customers. His need for autonomy could have kept him on the road. Insights such as these might eliminate or reduce the strength or influence of Phil’s negative emotions toward Jack. As Longfellow put it, "If we could read the secret history of our enemies, we should find in each man's life sorrow and suffering enough to disarm any hostility." When Phil realizes that Jack’s behavior derives from Jack’s core concerns for appreciation,

54 Such beliefs could result from what psychologists call the “fundamental attribution error”—the “tendency…to attribute another person’s behavior to dispositional factors (those internal to the person) rather than to situational (external) factors.” Jennifer K. Robbennolt & Jean Sternlight, Good Lawyers Should Be Good Psychologists: Insights for Interviewing and Counseling Clients, 23 OHIO ST. J. ON DISP. RESOL. 437, 462 (2008).
affiliation, autonomy, status, and role, he comes to see Jack more fully. This realization might even foster empathy, compassion, or other positive emotions toward Jack.

B. As a lens, directed at himself

Similarly, Phil could focus the core concerns lens on himself—before, during or after the negotiation. In doing so, Phil might recognize that he believes that Jack does not appreciate him and all that he has contributed by managing PJB. He might see that he has (or does not have) a need to for a stronger affiliation with Jack, Phil, Jr., or other people in the industry. He might recognize his own need for autonomy in managing the firm, and his concerns about status and having a fulfilling role in the business. Phil could realize that these core concerns stimulated some of his negative attitudes and actions toward Jack. And of course, Phil might be able to recognize that he, himself, has the same concerns in connection with the negotiation process and outcome.

C. As a lever, to stimulate positive emotions in Jack.

Such insights would enable Phil to use Jack’s core concerns as a lever to attempt to stimulate positive emotions in Jack. For instance, Phil might express appreciation for Jack’s commitment to PJB, his strong relations with customers, his willingness to travel, and other interests or perspectives that Jack expresses during the negotiation. Phil might build affiliation with Jack by recalling their long history of work and friendship; by sitting in such a way as to convey closeness; by initiating in-person, rather than email contact, and talking about the real issues in their relationship. In addition, he could respect Jack’s autonomy in the negotiation by consulting with Jack before making any decisions about negotiation procedure. He might propose a brainstorming process or ask Jack to suggest

---

56 Using the “three conversations” framework set forth in Difficult Conversations, these concerns would be part of the “Identity Conversation.” See STONE, ET AL., supra note 9, at 109-28.
57 FISHER & SHAPIRO, BEYOND REASON, supra note 11, at 52-68.
options for addressing various issues. He could acknowledge Jack’s status as a founder of the firm, as a great boiler salesman, as an expert on boilers, as a good golfer, and a bon vivant. Finally, Phil could try to ensure that Jack had a fulfilling role in the negotiation (i.e., a role that has “a clear purpose,” is “personally meaningful,” and “is not a pretense”), with lots of opportunities to speak freely and to influence the focus, procedures and outcome.

D. As a lever, to stimulate positive emotions in himself

Using the insights about his own core concerns as a lever, Phil might try to help Jack appreciate him by, say, asking Jack to listen to Phil describe his own work life and worries about the firm, and then to relate his understanding of what Phil said. Any work Phil did to build affiliation, described above in section C, also could stimulate positive emotions in himself. And Phil could expand his own autonomy by making recommendations and engaging in brainstorming. Finally, Phil might deliberately take the time to privately enjoy his own status as the manager of a substantial business and make sure that he, too, has an appropriate, fulfilling role in the negotiation.

***

Phil’s se of the Core Concerns System in this fashion—assuming the core concerns lens gives him accurate insights and that his exercise of the lever is genuine, skilful and appropriate in the context of their relationship and the moment—could produce positive emotions in both negotiators. This, in turn, would enhance their ability to engage in

interest-based negotiation. And that could lead to good, interest-based outcomes that are more satisfying to Phil and Jack than those likely to emerge from adversarial negotiation (or trial).

Understanding the Core Concerns System, I think you will agree, is simple. Implementation, however, is not always easy, and—as I shall show in the next section—negotiators who understand the system and intend to use it, sometimes are unable to do so.

III. Obstacles to Implementing the Core Concerns System

I have found the Core Concerns System extremely useful, not only in formal negotiations, but also during interactions with people in virtually any context. Successful implementation calls for deploying a systematic perspective in order to understand some common causes of negative emotions and then taking action, as appropriate, to foster positive emotions, which should enhance the parties’ chances of conducting interest-based negotiations or having better interactions.

The method is clear and easily grasped from reading Beyond Reason. In training programs based on the Beyond Reason—through lectures, demonstrations, and role-play exercises—students quickly learn to identify core concerns in others and in themselves, and develop good ideas about how to address them. And yet, I have observed, in myself and others with whom I have worked, certain obstacles to consistent, skillful implementation of the system in actual negotiations. For a variety of reasons, some negotiators who are familiar with the system and would like to use it—and even intend to use it—do not actually do so, or do not do so skillfully. Some do not even begin to use the
core concerns. Others may begin using the core concerns as a lens, but later lose track of them. Looking back, they wish that they had used the system, or used it more skillfully.65

This could happen to Phil. If it does, what could explain that outcome? The culprits could include any of the following intricately interrelated factors: an excessively self-centered focus; strong negative emotions; automatic, habitual ways of thinking, feeling, and behaving; insensitivity to emotions; insufficient social skills; or a distracted, wandering mind.

A. Excessively Self-Centered Perspectives.

Humorist Ambrose Bierce defines an egotist as “a person of low taste, more interested in himself than in me.”66 The strong tendency toward a self-centered focus is deeply ingrained in our society—and is a basic aspect of human nature. Neurologist James H. Austin, drawing in part on Buddhist teachings, identifies three “interactive components of selfhood”—the “I-Me-Mine.”

The I exists physically, feels, is aware, acts, knows, thinks, and personifies various roles.

Things happen to the Me, both physically and mentally. . . . [A]ll private thoughts, opinions, and body parts are “Mine.” All these possessions are Mine. My self is the sole axis around which the rest of the world revolves.

The triad obviously serves useful, constructive, and adaptive ends . . . [but] it also has a covert dysfunctional side. Zen tries to liberate, transform, and redirect these habitual, unfruitful energies along more constructive lines.

66 AMBROSE BIERCE, THE DEVIL’S DICTIONARY 61 (Filiquarian Pub’g 2006).
But can our very own sovereign \( I \) create problems? You bet it can. Let us begin by expressing its range of problems in simple a-b-c terms. Our \( I \) is also arrogant and aggressive. Even so, it has a vulnerable partner: the fearful \( Me \). This \( Me \) feels besieged. It can get battered.

Finally, our \( Mine \) is readily captured by its “own” greedy longings. It clutches at other people, it covets and clasps onto material goods. . . . It cherishes and clings to each of its biased opinions.\(^{67}\)

The focus on self both supports and draws reinforcement from the presence of strong emotions. Such a self-centered focus could undermine Phil’s ability to be genuinely curious about Jack, to listen to Jack,\(^{68}\) or to care about Jack. It also could explain his negative feelings toward Jack. Moreover, Phil could be so strongly centered on himself that he might even forget about his commitment to use the Core Concerns System with respect to Jack.\(^{69}\)

B. Strong Negative Emotions.

In much the same way that the “Star Wars” missile defense system could be knocked out by the very missiles against which it was designed to protect the U.S.,\(^{70}\) the Core Concerns System is vulnerable to the same emotions that it was created to address. In other words, before Phil can use the Core Concerns System, or while he tries to use it, these emotions might simply overpower his cognitive capacity or will to do so. This could happen before the negotiation begins, or at any point during the negotiation. For example, even if Phil is calm enough, before the negotiation, to use the core concerns as a lens to help him plan for it, Jack might do or say something during the negotiation, such as I have

\(^{67}\) James H. Austin, Zen-Brain Reflections: Reviewing Recent Developments in Meditation and States of Consciousness 13-14 (2006) [hereinafter Austin, Reflections].

\(^{68}\) See Stone et al., supra note 9, at 168-71 (1999).

\(^{69}\) Professor Leigh Thompson has identified egocentrism—“the tendency for people to view their experiences in a way that is flattering or fulfilling for themselves”—as a principal cause of ineffective negotiation. Thompson, supra note 44, at 6.

\(^{70}\) See Strobe Talbott, The Case Against Star Wars Weapons, TIME MAG., May 7, 1984, at 81.
suggested in the example above, that would prompt the outbreak of strong negative emotions that would dominate Phil’s thoughts and behavior.

C. Automatic, Habitual Ways of Thinking, Feeling and Behaving.

Phil’s ability to use the core concerns may be impaired by “top-down,” automatic, habitual ways of thinking, feeling, and behaving that do not take core concerns or other interests into account. Some of these—such as automatically thinking of his own interests first, becoming angry when he senses a threat to his sense of identity, and acting out his anger—might overlap with the excessively self-centered focus described above. Other troublesome habitual ways of thinking might include common cognitive barriers to wise negotiation. These include (1) the “fundamental attribution error,” or “tendency . . . to attribute another person’s behavior to dispositional factors (those internal to the person) rather than to situational (external) factors,” (2) “reactive devaluation”—a tendency to negatively evaluate a proposal that comes from a source deemed untrustworthy; and (3) “optimistic overconfidence”—a tendency to over-value the strength of one’s own position. In addition, Phil has many long-ingrained habits of thinking, feeling, and behaving in relation to Jack, any of which could stop him from using the Core Concerns System in this negotiation. Most of us are almost wholly unaware of such phenomena, in part because they may take place beneath our conscious awareness. Another reason for our limited awareness could be that we hold a “Naïve Realism” perspective, which Lee Ross and Donna Shestowsky summarize “in three first-person propositions”:

71 Here I use “top down” in the sense in which psychiatrist Daniel Siegel uses it, to mean “how engrained brain states can impinge on emerging neural circuit activations and thus shape our awareness of ongoing experience in the present moment. SIEGEL MINDFUL BRAIN, supra note 23, at 135. The term is used in various ways. Id. at 134-37.
72 See Robbenolt & Sternlight, supra note 54, at 462.
73 See Mnookin, Barriers, supra note 37, at 246.
74 See BARRIERS TO CONFLICT RESOLUTION, supra note 37, at 46-50, 59-60.
The first proposition is that I see actions and events as they are in reality or, in other words, that my perceptions and reactions are a relatively unmediated reflection of the “real nature” of whatever it is to which I am responding. The second proposition is that other people, to the extent that they are willing and able to see things in a similarly objective fashion, will share my perceptions and reactions. The third proposition pertains to the consequences of discovering that other individuals have perceived some event or reacted to it differently from me. In that case, I infer that they (but not I) have been influenced by something other than the objective features of the events in question. More specifically, I infer that their responses have been biased by their personal traits or dispositions, their motivations and emotions, their expectations and beliefs, the faulty or incomplete information available to them, or some other distorting influence.75

The perspective of naïve realism (itself an automatic way of perceiving and thinking) keeps us from noticing the operation of the automatic, habitual processes of thinking, feeling and behaving that I have described above. And the limited awareness I have described contributes to the common “gap,” described by Michael Moffitt and Scott Peppet, between how we advise ourselves to act, and how we actually act76—or, using Chris Argyris’ terminology, between our “espoused theory of action” and our “theory-in-use.”77 As a result of this gap, many negotiators who espouse an interest-based approach to negotiation are likely to follow a markedly-different theory-in-use, one “governed by four principles or values: (1) our intended purpose, (2) maximizing ‘winning’ and minimizing losing, (3) suppressing negative feelings and (4) emphasizing rationality.”78

For any of these reasons, Phil’s determination and ability to use the Core Concerns System may simply vanish—and he may not be aware that it has vanished.

---

76 Scott R. Peppet & Michael L. Moffitt, Learning How to Learn to Negotiate, in THE NEGOTIATOR’S FIELDBOOK 615, 617 (Christopher Honeyman & Andrea Kupfer Schneider eds., 2006).
77 Id. at 617-18. The terms “espoused theory of action” and “theory-in-use” were developed by Professor Chris Argyris. See Chris Argyris ET AL., ACTION SCIENCE (1985).
78 Peppet & Moffitt, supra note 77, at 620 (summarizing ideas of Chris Argyris).
D. Insensitivity to emotions.

Phil may lack the natural sensitivity or skill to recognize emotions, especially in others; this could prevent or impede his use of the Core Concerns System. And awareness of emotions could be nearly essential to remembering to use the Core Concerns System or feeling motivated to address them. Thus, if Phil does not actually become aware that Jack is experiencing negative emotions, he is unlikely to remember or be motivated to employ the Core Concerns System.

E. Insufficient Social Skills.

On the other hand, Phil may figure out which core concerns are motivating certain of Jack’s behaviors, decide what he needs to do in order to foster Jack’s core concerns, and then bungle the execution. For instance, he might determine that, in Fisher and Shapiro’s terms, he needs to “express appreciation” or “acknowledge status.” Yet his interpersonal skills may be inadequate to the task. He may be unable to figure out what to say or to actually say it in a way that Jack can interpret accurately.

F. Inadequate focus.

Another potential reason that Phil may inappropriately fail to use the Core Concerns System is that he is simply too distracted and unfocused to remember to do so. These distractions could come from emotions, thoughts, or sensations in the body, which incessantly intrude into most of our mental lives. And even if he remembers to use the core concerns as a lens in planning the negotiation, these distractions may cause him to

79 See Siegel, Mindful Brain supra note 23, at 300-01.
80 See Riskin, Contemplative Lawyer, supra note 66, at 25-26; Riskin, Knowing Yourself: Mindfulness, in THE NEGOTIATOR’S FIELDBOOK, supra note 77, at 239-40.
mindlessly abandon—or simply forget—this effort while he is negotiating or reflecting back on the negotiation.

***

Fisher and Shapiro provide a number of good behavioral techniques to help a negotiator prevent or reduce the power of some of these potential challenges, especially those associated with strong emotions. They recommend, for instance, that you enhance your awareness of your own emotions by, e.g., taking “your own emotional temperature,” asking yourself whether your emotions are “out of control,” “risky,” or “manageable.”

Next, they suggest that you “[s]oothe yourself: cool down your emotional temperature,” so that you can “be in control of your emotions, not have them control you.” Because it may be hard to think clearly after a strong negative emotion arises, they urge the negotiator to develop a plan in advance and select a self-soothing behavior before the negotiation, while still “able to reflect clearly.” They offer the following specific techniques:

- Slowly count backward from ten
- Breathe deeply three times, in through your nose and out through your mouth
- Pause. Allow yourself to sit comfortably in silence for a moment. Ask yourself what is at stake for you.
- Take a “justified” break to go to the bathroom or make a phone call. During the break, relax. Think about how to move the negotiation forward.
- Visualize a relaxing place like a sandy beach, a sunlit forest, or a symphony performance.
- Change the subject, at least briefly.
- Adopt a relaxed position: Sit back, cross your ankles, let your hands rest on your lap or the table.
- Let upsetting or offensive comments fly by and hit the wall behind you
- Call to mind a good walk-away alternative that you have prepared.

---

81 Fisher & Shapiro, Beyond Reason, supra note 11, at 147-48.
82 Id. at 150.
83 Id. at 150-51. They also suggest ways to calm yourself after the negotiation or during a break:
- Listen to calming music
- Distract yourself: Watch TV for a few minutes, make a phone call to a friend, read the paper
Any of these techniques might help Phil develop a state of mind in which he could
employ the Core Concerns System. Nonetheless, such states of mind tend to be temporary,
and in the heat of the moment, Phil might have trouble accessing them. For those reasons,
I describe below some “tools of awareness” that have the potential to enable negotiators to
more reliably and consistently overcome obstacles to using the Core Concerns System.
These tools include a number of specific techniques that can produce states of mind that,
with practice, can become traits.

IV. Overcoming the Obstacles to Using the Core Concerns System:
Mindfulness and Related Tools of Awareness

Each of the obstacles to using the core concerns framework described above—
strong, negative emotions; an excessively self-centered focus; automatic, habitual ways of
thinking, feeling and behaving; insensitivity to emotions; a distracted, wandering mind—
derives from, or is associated with, a lack of mindful awareness. Conversely, the presence
of mindful awareness could help Phil prevent or surpass these obstacles, thus enabling him
to use the Core Concerns System, when it is appropriate to do so.

In this Part, Section A describes the nature and meaning of mindfulness. Section B
gives a brief overview of some effects and outcomes of mindfulness practice. Section C
explains how to cultivate and deploy mindful awareness, and Section D theorizes about
how mindfulness practice and mindful awareness can help overcome the obstacles to
implementing the Core Concerns System that I described above in Part III.

A. The Meaning and Nature of Mindfulness

- Take a walk. But don’t obsess over who’s to blame for the anger-inducing situation. Try to
  appreciate the other’s perspective. Think about ways to deal with the situation.
- Forgive: Let go of the grudge.

/id. at 151-52.
As I generally use the term in this Article, “mindfulness” (or “mindful awareness”) means a certain way of paying attention—intentionally, moment-to-moment, with equanimity and without attachment—to whatever passes through the conventional senses and the mind.84 Researchers have “operationalized” the idea of mindfulness, that is, turned it into a construct that they could use for research.85 Bishop and his colleagues, for instance, define mindfulness to include: “the self-regulation of attention so that it is maintained on immediate experience, thereby allowing for increased recognition of mental events in the present moment . . . [and] a particular orientation toward one’s experiences in the present moment, an orientation that is characterized by curiosity, openness, and acceptance.”86 Building upon that definition, UCLA psychiatrist Daniel Siegel describes

84 In the words of Jon Kabat-Zinn, “Mindfulness can be thought of as moment-to-moment, nonjudgmental awareness, cultivated by paying attention in a specific way, that is, in the present moment, and as non-reactively, as non-judgmentally, and as openheartedly as possible.” JON KABAT-ZINN, COMING TO OUR SENSES: HEALING OURSELVES AND THE WORLD THROUGH MINDFULNESS 108 (2005). See also, JON KABAT-ZINN, WHEREVER YOU GO, THERE YOU ARE: MINDFULNESS MEDITATION IN EVERYDAY LIFE 3-7, passim (1994) [hereinafter KABAT-ZINN, WHEREVER YOU GO]; HENEPOLA GUNARATANA, MINDFULNESS IN PLAIN ENGLISH 149-54 (1991), also available at http://www.urbandharma.org/pdf/mindfulness_in_plain_english.pdf.

The term “mindfulness” can carry at least two other meanings. First, Harvard psychology professor Ellen Langer uses the term in connection with her notion of “mindful learning.” “When we are mindful,” she says, “we implicitly or explicitly (1) view a situation from several perspectives, (2) see information presented in the situation as novel, (3) attend to the context in which we are perceiving the information, and eventually (4) create new categories through which this information may be understood.” ELLEN LANGER, THE POWER OF MINDFUL LEARNING 111 (1997) [hereinafter LANGER, MINDFUL LEARNING]. See also ELLEN LANGER, MINDFULNESS 62-74 (1989). Although related, this Western idea differs from the Eastern notion of mindfulness on which this Article focuses. Essentially, the Eastern notion of mindfulness is based upon observing; Langer’s Western notion of mindfulness rests more on thinking. Second, there is a non-technical meaning of mindfulness, which is equivalent to paying attention or remembering something, reflected in injunctions to mind your manners or remember your ancestors or recall the suffering of others in times of joy.

For a discussion of various meanings of “mindfulness,” see SIEGEL, supra note 18, at 3-28.

85 See SIEGEL, MINDFUL BRAIN, supra note 23, at 11-13.

mindfulness as involving an “awareness of awareness” and an attitude toward moment-to-moment experience based upon “curiosity, openness, acceptance, and love (COAL).”\(^87\)

The opposite of mindfulness is mindlessness, which Professor Ellen Langer tells us “is characterized by an entrapment in old categories; by automatic behavior that precludes attending to new signals; and by action that operates from a single perspective. Being mindless, colloquially speaking, is like being on automatic pilot.”\(^88\)

People frequently confuse mindfulness with “flow,” a concept popularized by psychologist Mihaly Csikszentmihalyi.\(^89\) Daniel Siegel shows us that the two forms of awareness are quite different. To explain mindfulness, Siegel has developed the acronym “SOCK,” which is based on the idea that three “streams of awareness”—“sensation,” ”observation,” and “concept”—help us “know” the present moment, the fourth stream of awareness.\(^90\) Mindfulness, Siegel tells us, involves the disidentification with the objects of attention as the defining features of who we are . . . . This observer-made capacity for discernment is what distinguishes mindful awareness from the notion of “flow” in which we are non-self-consciously immersed in the sensations of an experience. In flow, we lose ourselves as immersion in sensation can “carry us away” and we become lost in the automaticity of that stream. At times that may be a good thing, as when we eat, make love, go for a walk, or ponder a problem. But in daily life keeping all four streams in balance may be at the heart of mindful living . . . .

Stress and suffering emerge throughout life. With mindful awareness a new possibility is created to reformulate the suffering while not avoiding the sensory experience. Nothing is intentionally blocked; rather all

\(^87\) SIEGEL, MINDFUL BRAIN, supra note 18, at 15.
\(^88\) LANGER, MINDFUL LEARNING, supra note 85, at 4. Although Langer’s notion of mind/fu/hess differs from the Eastern conception, Langer’s explanation of mind/lessness is the opposite of mindfulness in both senses of the latter term.
\(^89\) MIHALY CSIKSZENTMIHALYI, FLOW: THE PSYCHOLOGY OF OPTIMAL EXPERIENCE passim (1991) (Csikszentmihalyi considers flow an “optimal state of inner experience” that individuals can achieve by engaging in activities in which they can lose themselves, thus creating an “ordered” or “harmonious consciousness” in the individual.).
\(^90\) SIEGEL, MINDFUL BRAIN, supra note 23 at 64-65, 68-72.
guests are welcome. When a preconceived thought shows up at the door, it can be seen, observed, thought and known for what it is.91

This notion of accepting the reality of what is, rather than shutting it out, is a central premise of mindfulness, and finds poetic expression in Rumi’s ‘s *The Guest House*:

This being human is a guest house
Every morning, a new arrival
A joy, a depression, a meanness,
Some momentary awareness comes as an unexpected visitor.

Welcome and entertain them all
Even if they’re a crowd of sorrows,
who violently sweep your house empty of its furniture

Still treat each guest honorably,
He may be clearing you out for some new delight.

The dark thought, the shame, the malice,
Meet them at the door laughing,
and invite them in

Be grateful for whoever comes, because each has been sent as a guide from beyond.92

**B. Effects and Outcomes of Mindfulness**

When a person is not mindful, he is more likely to be governed by, or subject to, his thoughts, emotions, and body sensations, especially those that are automatic or habitual.93 At such times, the person is prone to behave in a “reactive”

---

93 Discussing the nature and outcomes of mindfulness practice and mindful awareness is exceedingly complex and potentially confusing, for a number of reasons. First, commentators often fail to distinguish between claimed outcomes of mindfulness and claimed aspects of the nature of mindfulness. For instance, an aspect of mindfulness includes the non-judgmental awareness of thoughts, emotions, and body sensations, whereas potential outcomes include freedom from impulsive behavior and clarity of mind. In addition, sometimes it is not clear to what extent benefits result from mindfulness practice as opposed to mindful awareness. Moreover, claims about the nature and outcomes of mindfulness may be grounded upon any number of sources, e.g., ancient or modern Buddhist philosophy and psychology; the experiences of teachers and practitioners of mindfulness meditation; or the outcomes of research studies.

Another source of confusion is the wide variety of ways in which commentators have characterized and labeled the forms of meditation commonly used to develop mindfulness. Some commentators, for
example, identify two forms of meditation: concentration and mindfulness. See GUNARATANA, supra note 85, at 149-56 (describing concentration and mindfulness as interdependent partners in meditation, the former “providing the power [that] keeps the attention pinned down to one item” while the latter “picks the objects of attention[] and notices when the attention has gone astray.’’). James Austin used the terms “concentrative” and “receptive” to make a similar, perhaps even stronger distinction. AUSTIN, REFLECTIONS, supra note 68, at 30-31. Others have identified three forms of meditation. For instance, Lutz, Dunne, and Davidson deal with the Tibetan tradition; the English-language terms they use are “Focused Attention,” “Open Presence,” and “Non-Referential Compassion.” See Antoine Lutz et al., Meditation and the Neuroscience of Consciousness, in Cambridge Handbook of Consciousness 499, 511-19 (Philip David Zelazo et al. eds., 2007) [hereinafter Lutz et al., Consciousness]. Non-Referential Compassion is similar but not identical to forms of meditation in the Theravadan tradition that are meant to inculcate certain positive states of mind: loving kindness, sympathetic joy, empathy, and compassion. See Sharon Salzberg, Loving-Kindness: The Revolutionary Art of Happiness passim (1995). Some meditation teachers would categorize these as concentration practices.

For purposes of this Article, it makes sense to distinguish three forms of meditation—concentration, mindfulness, and loving-kindness or compassion (and to ignore other forms). In practice these forms often are intricately interrelated. For example, mindfulness meditation training (especially in the Vipassana and Mindfulness-Based Stress Reduction traditions) begins with concentration forms of meditation; this commences with a focus on the breath, and then proceeds to body sensations, thoughts and emotions. Such experience provides a foundation for “bare attention” or “choice-less awareness,” which some say is the real mindfulness practice. See, e.g., Daniel J. Goleman, The Buddha on Meditation and States of Consciousness, in Meditation: Classic and Contemporary Perspectives 322, 333-34, 354 (Deane H. Shapiro, Jr. & Roger N. Walsh eds., 1984) (indicating a common emphasis on “bare attention” as a fundamental aspect of mindfulness practice across a comparative study of several meditation systems. See also NYANAPONIKA, THE HEART OF BUDDHIST MEDITATION 30-56 (1996) [hereinafter NYANAPONIKA, HEART]; NYANAPONIKA THERA, THE POWER OF MINDFULNESS: AN INQUIRY INTO THE SCOPE OF BARE ATTENTION AND THE PRINCIPLE SOURCES OF ITS STRENGTH (2001), available at http://www.buddhanet.net/pdf_file/powermindfulness.pdf [hereinafter NYANAPONIKA, POWER OF MINDFULNESS]. Many contemporary mindfulness meditation training programs in the United States also include meditation practices designed to develop positive mental states, including “kindly awareness” or “loving-kindness.” See, e.g., ZINDEL V. SEGAL ET AL., MINDFULNESS-BASED COGNITIVE THERAPY FOR DEPRESSION: A NEW APPROACH TO PREVENTING RELAPSE 93-94, 302-03 (2002) [hereinafter SEGAL, ET AL., COGNITIVE THERAPY]. People planning to do a mindfulness or concentration meditation begin or end their session with loving-kindness, and are to be mindful toward anything that arises during loving-kindness practice in general. In addition, the mindfulness perspective is commonly said to include loving-kindness toward all objects of awareness. For more on loving-kindness and related forms of meditation, see Salzberg, supra, passim.

Another cause of confusion is that commentators from different practice traditions and various research traditions may have different understandings of the nature and outcomes of these types of meditation. See Lutz et al., Consciousness, supra note 90, at 508-10. For a review of various kinds of meditation, see generally Daniel Goleman, The Meditative Mind: The Varieties of Meditative Experience (1988) [hereinafter Goleman, Meditative Mind].

A related problem is that in various contemplative traditions and in research studies, different terms may be employed to label similar forms of meditation. Lutz, Dunne, and Davidson explain “the often confusing use of the terms ‘mindfulness’ and ‘awareness’:

In the Mindfulness Based Stress Reduction (MBSR) designed by Jon Kabat-Zinn, for example, the term “mindfulness” is used primarily to refer not to the focusing aspect of mind, but rather to the meta-awareness that surveys that focus and its relation to the intended object. Likewise, in MBSR the term “awareness” sometimes seems to stand primarily for attention or the focusing aspect of mind. In contrast, popular works on Tibetan Buddhist meditation . . . use these same two terms, but their meaning is reversed: “mindfulness” refers to attention or focus, while “awareness” refers to a faculty of mind that surveys the mental state at a meta-level.

Lutz et al., Consciousness, supra note 90, at 509.

Moreover, people practice mindfulness meditation for various purposes—ranging from spiritual enlightenment to just lightening up. Deane Shapiro found that, with practice, meditators’ intentions moved
fashion, rather than a thoughtful, “responsive” fashion. However, when a person is mindful, he can experience and observe thoughts, emotions and body sensations—be “present” with them—and yet enjoy a degree of freedom from them, which enables the person to behave skillfully or responsively. As Shauna Shapiro and Linda Carlson explain:

To the extent that a person is able to observe the contents of consciousness, he or she is no longer completely embedded in or fused with such content. For example, if a person is able to see it, [then] that person is no longer merely it; that is, that person must be more than it. Whether the it is pain, depression, or fear, reperceiving allows one to disidentify from thoughts, emotions, and body sensations as they arise, and simply be with them instead of being defined (i.e., controlled, conditioned, determined) by them. Through reperceiving one realizes that “this pain is not me,” “this depression is not me,” “these thoughts are not me,” as a result of being able to observe them from a metaperspective.

In recent years, mindfulness practices have made significant contributions in many sectors of Western society, including athletics, psychotherapy, health care, and education.

Mindfulness meditation has been an important part of the training provided by professional...
basketball coach Phil Jackson, who has enjoyed extraordinary success as coach of the Chicago Bulls and the Los Angeles Lakers.\(^9^6\) In psychology, mindfulness practice has proved successful in interventions designed to address anxiety and depression—using Mindfulness-Based Stress Reduction, Mindfulness-Based Cognitive Therapy, or Acceptance and Commitment Therapy—and in treating more complex personality disorders.\(^9^7\)

In education, mindfulness meditation can promote basic values, such as cognitive and academic performance, psychological well-being and mental health, and the development of the “whole person.”\(^9^8\) Mindfulness meditation has made inroads into legal and dispute resolution education, appearing in offerings that carry academic credit as well as extra-curricular courses and continuing education programs for lawyers, judges, mediators and negotiators.\(^9^9\)

\(^9^7\) Shauna Shapiro & Linda Carlson, supra note 95, at 64-73.

\(^9^9\) See generally, Symposium, Mindfulness in Law and Dispute Resolution, 7 Harv. Negot. L. Rev. 1 (2002); Riskin, Contemplative Lawyer, supra note 66; Riskin, Mindfulness, supra note 66, at 79-91.

C. Cultivating and Deploying Mindfulness

Mindfulness is both a path and a destination. In the words of Buddhist monk and scholar Nyanaponika Thera, mindfulness is “the unfailing master key for knowing the mind, and is thus the starting point; the perfect tool for shaping the mind, and is thus the focal point; [and] the lofty manifestation of the achieved freedom of the mind, and is thus the culminating point.” Shauna Shapiro and Linda Carlson distinguish between “big M” Mindful Awareness and “little m” mindfulness practice.

One cultivates the ability to be mindful by practicing mindfulness. The cultivation process can be formal or informal. Formal cultivation involves practicing mindfulness meditation, an ancient set of techniques most extensively developed by followers of the

---

I have taught a number of law school courses involving mindfulness, including Understanding Conflict, a course in Dispute Resolution for LL.M. students at the University of Missouri School of Law, and a Tools of Awareness for Lawyers course at the University of Florida. Mark Umbreit, Professor of Social Work and Conflict Resolution at the University of Minnesota, introduced a course called Peacebuilding through Transformative Dialogue in the Global Community: A Mindfulness-Based Approach. See The Center for Contemplative Mind in Society, www.contemplativemind.org/programs/academic/fellowships.html (Last visited July 14, 2009).

Bar associations and organizations of dispute resolution professionals also have sponsored mindfulness programs. Along with others, for example, I have been involved in presentations or workshops on mindfulness for the American Bar Association, the Massachusetts Bar Association, the Florida Bar Association, the Missouri Bar Association, the Association for Conflict Resolution, the New England Association for Conflict Resolution, the Conflict Resolution Association of Northern California, and many other similar groups. Recently, the Annual Northwest Dispute Resolution Conference at the University of Washington School of Law included five concurrent sessions dealing with mindfulness. http://mediate.com/nwadr/NWADR_Conference_Brochure.pdf (last visited July 14, 2009).

The Center for Contemplative Mind in Society sponsors meditation retreats for lawyers and law students and has offered mindfulness training for judges. See http://www.contemplativemind.org/programs/law/pastevents.html (last visited July 14, 2009).

As Krishnamurti put it, “Meditation is not a means to an end. It is both the means and the end.” Jiddu Krishnamurti, quoted in SURYA DAS, BUDDHA IS AS BUDDHA DOES: THE TEN ORIGINAL PRACTICES FOR ENLIGHTENED LIVING 136 (2007). Researchers studying mindfulness have sought to distinguish between the nature of mindfulness and the outcomes of mindfulness. See Baer et al., supra note 87, at 42.

SHAPIRO & CARLSON, supra note 95, at 4-8.
Buddha. In mindfulness meditation, one systematically learns to pay attention to the breath, body sensations, thoughts, and emotions—one at a time, at first, and then simultaneously.\(^{103}\) Informal practice includes a number of techniques that produce present-moment, non-judgmental awareness in daily life, such as deciding to be mindful during certain tasks or events—e.g., brushing your teeth, answering the phone, waiting for a stop light to change, or standing in line at the grocery store.

As a general matter, people who achieve a state of mindful awareness cannot maintain it indefinitely. Even advanced practitioners frequently lose it.\(^{104}\) With sufficient and continued practice, however, a person can become more adept at regaining and sustaining it.\(^{105}\) Eventually, mindfulness can change from a “state” to a “trait.”\(^{106}\)

D. How Mindfulness Meditation or Mindfulness Can Help Overcome Obstacles to Implementing the Core Concerns System

The ability to observe thoughts, sensations, and emotions with equanimity makes it easier to look for, or automatically recognize, their root causes, which sometimes are core concerns. In this way, mindful awareness affords a person an opportunity to deliberate

\(^{103}\) For basic information about mindfulness meditation, see Shapiro & Carlson, supra note 95 at 52, passim; Kabat-Zinn, Wherever You Go, supra note 85, passim; Gunaratana, supra note 85, passim. Much of my own experience with practicing and teaching meditation has been in the Theravadan tradition and in Mindfulness-Based Stress Reduction. Theravadan Buddhism, which is prevalent in Sri Lanka, Thailand, Burma, Laos and Cambodia, emphasizes mindfulness practice, which also is known as vipassana meditation and insight meditation. Tibetan Buddhism and Zen Buddhism—the latter dominant in East Asia, including China, Korea, and Japan—incorporate, but place less emphasis upon, mindfulness meditation practices. See Wapola Rahula, What the Buddha Taught xii (1959); Heinrich Dumoulin, Zen Buddhism: A History: India and China 27 (1988). For an explanation of modern Mindfulness-Based Stress Reduction approach, see Jon Kabat-Zinn, Full Catastrophe Living: Using the Wisdom of Your Body and Mind to Face Stress, Pain and Illness (1990); Segal et al., Cognitive Therapy, supra note 90; Center for Mindfulness in Medicine, Health Care, and Society, Univ. of Mass. Med. Sch., http://www.umassmed.edu/content.aspx?id=41252. (Last visited Oct. 1, 2009). For a discussion of various forms of meditation, see Goleman, Meditative Mind, supra note 94, passim.

\(^{106}\) See Siegel, Mindful Brain, supra note 23, at 118-21.
about the significance of the particular core concern at play, and to decide whether and how to address it. Section 1, below, explains how this process works, in general, with respect to each of the obstacles to using the Core Concerns System that I identified in Part III, above: excessively self-centered perspectives; strong negative emotions; automatic, habitual ways of thinking, feeling and behaving; insensitivity to emotions; and insufficient social skills. Section 2 suggests how mindful awareness could help Phil use the Core Concerns System, as appropriate, in his negotiation with Jack.

1. In General

In this section, I propose that mindfulness meditation or mindful awareness can help reduce the obstacles to using the Core Concerns System described above by (a) Diminishing attention to self-centered concerns and thereby enhancing attention others; (b) Reducing the strength of negative emotions and enhancing positive emotions, including compassion toward other and self; (c) Developing awareness, distance and freedom regarding thoughts, emotions, and behaviors; (d) Fostering sensitivity to the emotions of others; and (e) Developing social skills. Each of these elements may interact with all or most of the others. In an attempt at clarity, however, I present them separately.

a. Diminished Attention to Self-Centered Concerns.

Buddhist teachings hold that human suffering arises from an attachment to the sense of self, along with the belief that we can achieve lasting contentment through satisfying the self by gaining or keeping what is pleasant (which is associated with craving) and by avoiding that which is unpleasant (which is associated with aversion).107 In

---

Buddhist thought, however, the self, or ego, is an illusion, a concept that arises moment to moment. It lacks permanence-- as does everything else.\textsuperscript{108} Mindfulness meditation is part of the Buddhist path to develop these insights and thus reduce suffering.\textsuperscript{109} In Shauna Shapiro and Linda Carlson’s words:

[A]s one strengthens the capacity for mindful observing of mental activity there is often a corresponding shift in the self-sense. The “self” starts to be seen through or deconstructed—that is, it is realized to be a psychological construction, an ever-changing system of concepts, images, sensations, and beliefs. These aggregates or constructs that were once thought to compose the self, are eventually seen to be impermanent and fleeting . . . .

Through reperceiving, not only does a person learn to stand back from and observe his or her inner commentary about life and the experiences encountered, a person also begins to stand back from his or her “story” about who and what he or she ultimately is. Identity begins to shift from the contents of awareness to awareness itself.\textsuperscript{110}

A famous American Indian story tells illuminates the choice between a focus on the self and other:

An old Cherokee is teaching his grandson about life. “A fight is going on inside me,” he said to the boy.

“It is a terrible fight and it is between two wolves. One is evil - he is anger, envy, sorrow, regret, greed, arrogance, self-pity, guilt, resentment, inferiority, lies, false pride, superiority, and ego.” He continued, “The other is good - he is joy, peace, love, hope, serenity, humility, kindness, benevolence, empathy, generosity, truth, compassion, and faith. The same fight is going on inside you - and inside every other person, too.”

The grandson thought about it for a minute and then asked his grandfather, “Which wolf will win?”

The old Cherokee simply replied, “The one you feed.”\textsuperscript{111}

\textsuperscript{108} See \textit{Joseph9, One Dharma: The Emerging Western Buddhism} 151-56 (2002).
\textsuperscript{109} See \textit{generally, Nyanaponika, Heart}, supra note 90. \textit{See also Goldstein, supra} note 103, at 132-56.
\textsuperscript{110} Shapiro & Carlson, supra note 95, at 97 (drawing upon S.C. Hayes et al., Acceptance and Commitment Therapy (1999)).
The metaphor of the two wolves finds support in contemporary neuroscience. Neurologist James Austin identifies two neural networks in the brain; one network is self-centric (or ego-centric), and the other network is other-centric (or allo-centric). Activation of these circuits correlates with a focus on either self or other. Although these circuits do not precisely correspond with the good wolf and the bad wolf, the bad wolf does correspond roughly with the aspects of the self-centric network that manifest as what Austin calls the “pejorative self” or the “problematic self.” The two networks have a “see-saw,” reciprocal relationship; when one is particularly active, the other is relatively inactive. Thus, when we are focusing heavily on ourselves, we are not paying much attention to others, and vice versa. When we do not deliberately focus our attention on either self or other, these circuits automatically trade off dominance two or three times each minute. Most incoming stimuli are filtered first through the self-centric network, which gives that network a “major head start in shaping all of our priorities.” When a person is mindful, however, the manifestations of each network (e.g., self-centered or other-centered thoughts, emotions, perceptions, and beliefs) are easier to notice; they appear in “bolder relief.” That makes it easier to observe the beliefs, perceptions, emotions, and impulses associated with each circuit, and to examine them or decide quickly whether to follow them or let them be. In other words, mindful introspection

113 The two circuits overlap substantially with what neurologists have called “top-down” and “bottom-up” circuits. See id. at 29-34; SIEGEL, Mindful Brain, supra note 23, at 134-40.

enhances a person’s ability to decide which wolf to feed. And we feed—and strengthen—
each circuit by attending to it or acting in accord with it. Neurologist James Austin
describes the transformation of the “pejorative self” or “problematic self” through long
term Zen practice (of which mindfulness is an important aspect) in the following two

To the extent that meditation practice or mindfulness reduces the dominance or
strength of the “pejorative self,” it decreases the activity of the self-centric network,
allowing the allocentric network activity to increase; this, in turn, produces greater

\textsuperscript{119} James H. Austin, Your Self, Your Brain and Zen, 5 Cerebrum 5 [No. 1, Winter 2003][ Hereinafter, Austin, \textit{Your Self}].

opportunities and inclinationsto focus on other persons. Thus, empathy, compassion and kindness can arise naturally—at least in theory.

Of course, most practitioners of mindfulness meditation do not fully succeed in transforming the problematic aspects of the self, or even get insights about the impermanent nature of the self that I described above. However, many practitioners do make progress in this direction. They get “small insights”—intuitive glimpses in the direction of what Austin has called “selfless insight.” In Austin’s view, “When the hard edges of the self soften . . . or when the self recedes or is less dominant, that leaves room for our natural instincts of compassion to emerge. As self becomes less intrusive, the other networks in the brain become more active.” A Hindu saying puts it more poetically:

When I forget who I am I serve you.
Through serving I remember who I am
And know I am you

b. Reducing Negative Emotions and Enhancing Positive Emotions, Including Compassion, Toward Other and Self.

Mindfulness can reduce the experience of stress, anxiety and depression; enhance the ability to regulate emotion, and promote the development of positive mental states.

123 Telephone Interview with James H. Austin, M.D. (Nov. 4, 2008). For fuller explanations, see Austin, Reflections, supra note 68, at 197-200; Austin, Insight, supra note 113, at 103-12, 187-88.
124 Shapiro & Carlson, supra note 95, at 98.
In particular, mindfulness can help us catch the negative thoughts, which could precipitate negative emotions and reactive behaviors, and examine them, or just let them go.\footnote{127 See SEGAL ET AL., supra note 90, at 244-68.}

Through the practice of mindfulness meditation, positive emotions, such as happiness,\footnote{128 Richard J. Davidson and his colleagues gave a Mindfulness-Based Stress Reduction course to high tech executives with no previous experience in meditation. One result was an increase in neural activity in the left prefrontal cortex, which is associated with happiness. Richard J. Davidson et al., \textit{Alterations in Brain and Immune Function Produced by Mindfulness Meditation}, 65 PSYCHOSOMATIC MEDICINE 564, 569 (2003).} compassion for self\footnote{129 Shauna Shapiro et al., \textit{Meditation in Higher Ed.}, supra note 99, at 22-23.} and others, and empathy\footnote{130 Id. at 21-22.} tend to develop naturally,\footnote{131 See Id. at 22-23 (proposing, \textit{inter alia}, that meditation practice over an extended period of time may sensitize the brain’s limbic circuitry, which is essential to empathy and compassion).} along with insights about the self and about one’s own suffering, and from a recognition that others suffer in much the way that we do.

Professor Clark Freshman writes that “[m]indfulness promotes happiness in at least three ways[]”:

First, as new research continues to show, mindfulness itself increases happiness and the predisposition to happiness. Second, internal mindfulness lets us learn what puts us in a good mood. Chocolate may put Columbia doctors in a good mood, but it may put those of us predisposed to migraines in a rather foul mood. Third, internal mindfulness lets us know when our emotions may be efficient for negotiating. Awareness of our own positive emotions may tell us we are in a kind of sweet spot, much as the sweet spot of a tennis racket is the best place for many shots. And awareness of our negative emotions my reveal what Ekman calls a “hot spot” of negative
emotions or strained thinking. This is often not the best time to act, or even to take our thoughts too seriously.\textsuperscript{132}

The same meditation traditions that promote mindfulness meditation also employ a set of practices specifically intended to produce certain positive states of mind, such as loving-kindness, compassion, sympathetic joy, and equanimity.\textsuperscript{133} In the West, the most widely used of such meditative practices is loving-kindness, which involves sending certain good wishes—e.g. “May you be free from danger,” “May you have mental happiness,” “May you have physical happiness,” and “May you have ease of well-being”\textsuperscript{134}—first to yourself and then, in sequence, to others, ranging from a mentor or someone for whom you have great affection, to a close friend, a “neutral” person,” a “difficult” person, and then to all persons or all beings.\textsuperscript{135}

In negotiations, the development of compassion and other positive emotions toward others can make it more likely that the negotiator will want to benefit his counterpart.\textsuperscript{136} For that reason, the negotiator may be more likely to try to find opportunities to address the interests of the person with whom he is negotiating, an essential element of the Core Concerns System as well as of other interest-based approaches to negotiation.\textsuperscript{137}

\textsuperscript{133} See Salzberg, supra note 90.

\textsuperscript{134} Id. at 60. Writers have formulated the loving-kindness phrases in many ways. See, e.g., Leonard L. Riskin, \textit{Awareness in Lawyering: A Primer on Paying Attention}, in \textit{The Affective Assistance of Counsel: Practicing Law as a Healing Profession} 447, 460-63 (Marjorie Silver, ed. 2007).

\textsuperscript{135} Id. at 18-100. Loving-Kindness meditation resembles the Tibetan Buddhist practice known as “Pure Compassion,” which neuroscientists have studied extensively. See, e.g., Antoine Lutz et al., \textit{Regulation of the Neural Circuitry of Emotion by Compassion Meditation: Effects of Meditative Expertise}, 3 PLoS ONE e1897 (2008), available at http://psyphz.psych.wisc.edu/web/pubs/2008/LutzRegulationPLoSONE.pdf [hereinafter Lutz et al., \textit{Neural Circuitry}] (stating that, “[t]he mental expertise to cultivate positive emotion alters the activation of circuits previously linked to empathy and theory of mind in response to emotional stimuli.”); Sharon Begley, \textit{Train Your Mind, Change Your Brain: How a New Science Reaves Our Extraordinary Potential to Transform Ourselves} 233-40 (2007).

\textsuperscript{136} See Begley, supra note 136, at 238-40.

\textsuperscript{137} For other interest-based approaches to negotiation, see supra, notes 5-10 and accompanying text.
c. Awareness, Distance, and Freedom Regarding Ways of Thinking, Feeling, and Behaving

As I indicated above, mindful awareness involves a particular relationship (moment-to-moment and without judgment) to thoughts, emotions and bodily sensations. A simple heuristic device, the “Triangle of Awareness”—developed at the Stress Reduction Clinic at the University of Massachusetts Medical School at Worcester—, helps illustrate this idea. It appears as Figure 3.

Figure 3. The Triangle of Awareness

The points of the triangle are Thoughts, Emotions, and (Body) Sensations. These three kinds of phenomena interact, and each can either strengthen or weaken the other. A thought, for instance, can precipitate an emotion or a body sensation. Any of these phenomena can play a role in precipitating behavior. Attending to thoughts, emotions, and body sensations with kindly curiosity and without judgment is the essence of mindfulness; and it is part of extensive instructions on “choiceless awareness.”

Researchers have documented benefits of happiness to performance in a wide variety of activities. See Huang & Swedloff, supra note 29 at 335-37. (Briefly surveying the research and citing studies). See also, BARBARA L. FREDERICKSON, POSITIVITY: GROUNDBREAKING RESEARCH REVEALS HOW TO EMBRACE THE HIDDEN STRENGTH OF POSITIVE EMOTIONS, OVERCOME NEGATIVITY, AND THRIVE (2009). See generally, MARTIN SELIGMAN, AUTHENTIC HAPPINESS: USING THE NEW POSITIVE PSYCHOLOGY TO REALIZE YOUR POTENTIAL FOR LASTING FULFILLMENT (2004).

Prepared by teachers at the Stress Reduction Program at the Center for Mindfulness in Medicine, Health Care and Society at the University of Massachusetts Medical School, Worcester, MA. Used with permission of the Stress Reduction Clinic, U. Mass. Medical School.

See SEGAL ET AL., COGNITIVE THERAPY, supra note 90, at 322-23 (…in mindfulness practice, a person’s attention is opened to admit whatever enters experience, while at the same time, a stance of kindly curiosity...).
Once one is aware of these phenomena without judging them, one can achieve a certain “distance” from them, seeing them simply as objects of awareness rather than part of one’s identity. In other words, one can see the thoughts as “just thoughts,” body sensations as “just body sensations” and emotions as “just emotions.” In this way, a person can mentally acknowledge—or notice—the presence of these phenomena, but not be “attached” to or identified with them.

Being mindful in this way requires a little equanimity, and produces even more of it. By welcoming, or acknowledging the presence of, particular thoughts, emotions, and body sensations, one gains a measure of freedom from their power.

As Shauna Shapiro and Linda Carlson explain:

[R]eperceiving [the product of mindfulness practice] interrupts automatic maladaptive habits. People become less controlled by particular emotions and thoughts that arise, and in turn are less likely to automatically follow them with habitual reactive patterns. For example, if anxiety arises, and a person strongly identifies with it, there will be a greater tendency to react to the anxiety unskillfully and subsequently regulate it by some behavior such as taking action, or numbing it with substances.

Noting should be done very softly, like a whisper in the mind, but with enough precision and accuracy so that it connects directly with the object. For example, you might label each breath, silently saying *in, out or rising, falling*. In addition, you may also note every other appearance that arises in meditation. When thoughts arise, note *thinking*. If physical sensations become predominant, note *pressure, vibration, tension, tingling,* or whatever it might be. If sounds or images come into the foreground, note *hearing or seeing*.

The note itself can be seen as another appearance in the mind, even as it functions to keep us undistracted. Labeling, like putting a frame around a picture, helps you recognize the object more clearly and gives greater focus and precision to your observation.

Mental noting supports mindfulness in another way, by showing us when awareness is reactive and when it is truly mindful. For example, we may be aware of pain in the body, but through a filter of aversion. Without the tool of noting, we often do not recognize the aversion, which may be a subtle overlay on the pain itself. The tone of voice of the mental note reveals a lot about our minds...[S]imply changing the tone of the note can often change your mind state. Noting refines the quality of mindfulness, that very particular, nonreactive awareness.

as drinking, smoking, or overeating. Reperceiving allows a person to step back from the anxiety, to see it clearly as simply an emotional state that is arising and will in time pass away. Thus, this knowledge of the impermanence of all mental phenomena allows a higher level of tolerance for unpleasant internal states. 

This ability to step back from thoughts, emotions, and body sensations also explains why mindfulness has proved useful in treating obsessive-compulsive disorder (OCD)\textsuperscript{142} and why, in conjunction with cognitive-behavioral therapy, it has reduced the rate of relapse among people with depression who had had three or more relapses.\textsuperscript{143} In a more general sense, this ability to step back also explains the quality of “non-anxious presence” that often is associated with mindfulness.\textsuperscript{144}

\textbf{d. Sensitivity to Emotions of Others}

In the common experience of mindfulness meditators, the practice develops sensitivity to one’s own emotions. It also tends to develop sensitivity to the emotions of others, an aspect of what Clark Freshman calls “external mindfulness.”\textsuperscript{145} This sensitivity could develop from other features or outcomes of mindfulness: a curiosity about the other person, an ability to be “present” to the suffering of another, an acceptance of one’s own reactions to the emotions of others, and positive emotions, including compassion, for the other. In addition, the ability to observe one’s own thoughts, emotions and body

sensations, without judgment, may help develop a sensitivity to these phenomena as they arise in others.\(^{146}\)

\section*{e. Social Skills}

I have written elsewhere that mindfulness tends to develop “emotional intelligence.”\(^{147}\) The idea of Emotional Intelligence, as proposed and popularized by Daniel Goleman, entails five “basic emotional and social competencies:” self-awareness, self-regulation, motivation, empathy, and social skills.\(^{148}\) Emotional self awareness is the most basic of such competencies. “Lacking that ability,” as Daniel Goleman puts it, we are vulnerable . . . to being sidetracked by emotions run amok. Such awareness is our guide in fine-tuning on-the-job performance of every kind, managing our unruly feelings, keeping ourselves motivated, tuning in with accuracy to the feelings of those around us, and developing good work-related social skills, including those essential for leadership and teamwork.\(^{149}\)

Mindfulness meditation can help develop emotional self awareness, self-regulation, motivation and empathy;\(^{150}\) these, in turn are likely to help produce the fifth emotional intelligence competency--social skills.\(^{151}\)

\section*{f. The Ability to Focus}

\(^{146}\) See SIEGEL, MINDFUL BRAIN, supra note 23, at 157-58.

\(^{147}\) See Riskin, Contemplative Lawyer, supra note 66, at 47-48.

\(^{148}\) The term “emotional intelligence” was first used in Peter Salovey & John D. Mayer, Emotional Intelligence, 9 IMAGINATION, COGNITION & PERSONALITY 185 (1990). Daniel Goleman developed a particular version of emotional intelligence, which he popularized in DANIEL GOLEMAN, EMOTIONAL INTELLIGENCE: WHY IT CAN MATTER MORE THAN IQ (1995) and DANIEL GOLEMAN, WORKING WITH EMOTIONAL INTELLIGENCE (1998) [hereinafter, GOLEMAN, WORKING WITH]. In 2006, he developed the idea of “Social Intelligence,” which he divided into “Social Awareness” and “Social Facility.” DANIEL GOLEMAN, SOCIAL INTELLIGENCE: THE NEW SCIENCE OF HUMAN RELATIONSHIPS 84 (2006). In this Symposium, Peter Reilly explains the “four branches” of Salovy and Mayer’s notion of emotional intelligence. Peter Reilly, Mindfulness, Emotions, and Mental Models: Theory that Leads to More Effective Dispute Resolution, 10 NEVADA L.J. __, ____ (2010).

\(^{149}\) GOLEMAN, WORKING WITH, supra note 150, at 55 (1998).

\(^{150}\) See Riskin, Contemplative Lawyer, supra note 66, at 47-48.
The ability to concentrate develops when one practices mindfulness meditation.\(^\text{152}\) Of course, concentration enhances any activity—playing the trombone, rap dancing or reading this Article. William James, widely considered the father of American psychology, described the importance of this skill:

[T]he faculty of voluntarily bringing back a wandering attention, over and over again, is the very root of judgment, character, and will. . . . An education which should improve this faculty would be the education par excellence. But it is easier to define this ideal than to give practical directions for bringing it about.\(^\text{153}\)

Mindfulness practices provide the directions that James sought. And concentration is the foundation of all mindfulness. Among other things, the ability to concentrate, or to achieve freedom from distractions and from the wandering mind (a.k.a. “monkey mind”), can help the negotiator to avoid being distracted and to remember to use the Core Concerns System, and to keep using it.\(^\text{154}\)

***

Figure 4 provides a graphic summary of the foregoing explanation of how, in theory, mindful awareness could help a negotiator overcome obstacles to employing the Core Concerns System when it is appropriate to do so.

**Figure 4. How Mindfulness Can Help Address Obstacles to Using the Core Concerns System.**

2. **In Phil’s Negotiation with Jack.**

¹⁵⁵ In her comments on a draft of this article, Melissa Blacker, Senior Teacher at the Stress Reduction Clinic at the University of Massachusetts Medical School, offered a more nuanced explanation that is difficult to reflect in a graphic: “Mindfulness practice can help increase awareness of, and then, perhaps, help to reduce the power of, SNE.” E-mail message from Melissa Blacker, Senior Teacher, Stress Reduction Clinic, University of Massachusetts Medical School, to Leonard Riskin (June 11, 2009) (on file with author).

¹⁵⁶ Melissa Blacker also offered a more nuanced explanation of this idea in her comments on a draft of this article: “Mindfulness may reveal and bring awareness to automatic, habitual ways of thinking, [feeling and behaving] and perhaps ultimately promote freedom from these habitual patterns.” Email message from Melissa Blacker, Senior Teacher, Stress Reduction Clinic, University of Massachusetts Medical School, to Leonard Riskin (June 11, 2009).
I have explained how, in theory—and in general—mindfulness could help a negotiator overcome a series of specific obstacles to using the Core Concerns System. Now let us get down to specifics. How might mindfulness help Phil use the Core Concerns System, as appropriate, in his negotiation with Jack? To address this question, I begin with an overview and then analyze a specific incident in the negotiation.

Imagine that, in addition to learning about the Core Concerns System, Phil takes a training program in mindfulness meditation and practices rigorously for some time. Add the heroic (and problematic) assumption that Phil becomes adept at developing and sustaining mindful awareness. He then readies himself to negotiate with Jack, intending to use the Core Concerns System to prepare for, conduct, and review the negotiation.

In general, this is how mindfulness might help Phil address the obstacles to using the Core Concerns System.

a. **Obstacle: Excessively self-centered perspectives.** Imagine that Phil is too focused on himself to listen to, or care about, Jack.

   Mindful awareness, developed through extensive meditation practice, should bring about relative deactivation of this self-centered focus. The accompanying enhancement of the other-centered focus could help Phil direct more attention to Jack and less attention to himself. At the very least, mindfulness would make it easier for Phil to maintain non-judgmental awareness of the manifestations of both of the neural circuits, rather than being dominated by the manifestations of the self-centered circuit. Thus, he should be able to notice and

---

157 The extent of practice experience has a linear correlation with changes in awareness and related neuroplastic changes in the brain. For an overview of this issue, see Begley, supra note 132, at 233-39. See also infra notes 182-85 and accompanying text.

158 See supra notes 113-19 and accompanying text.
distinguish the thoughts, impulses, and intentions that are associated with greed from those that are associated with curiosity about, and generosity toward others. Furthermore, as Phil becomes more aware of the manifestations of his “problem self,”¹⁵⁹ such as an intention to harm Jack or to inappropriately benefit himself, he may deliberately chose to reject such thoughts and impulses, or to just “let them be.” Also, greater activity in the allo-centric circuit naturally produces curiosity about Jack, as well as compassion and kindly behavior toward him; thus, Phil could become more inclined to really listen to Jack, making it easier for Phil to recognize Jack’s core concerns and to want to help him.

b. *The Obstacle: Strong negative emotions*: Phil is overcome by strong negative emotions, such as anger disgust toward Jack (or similar feelings toward himself).

Mindful awareness can help Phil by fostering non-judgmental awareness of such emotions, and distance and freedom from them, as well as calm, insight, and positive emotions.

Phil succumbs to automatic, habitual patterns of thoughts, emotions, and behaviors that are negative.

Mindfulness should enable him to achieve a distance and freedom from these phenomena. (I discuss this concept extensively in connection with a specific example below).

d. *The Obstacle: Insensitivity to emotions.* Phil simply does not notice emotions in Jack or in himself.

¹⁵⁹ *See supra* notes 120-22 and accompanying text.
Mindfulness enhances sensitivity to emotions. Thus, with mindfulness—especially what Clark Freshman calls “external mindfulness”—Phil may more readily notice Jack’s fear, anger, and frustration—as well as his own, and therefore feel impelled to look for their causes, which could be core concerns.

e. Obstacle: Insufficient social skills. He knows what to do, but lacks the judgment and interpersonal skills to do it well.

Mindfulness enhances Phil’s social skills, so if Phil decides to use Jack’s core concern for appreciation as a lever, he would be more likely to do so skillfully.

f. The Obstacle: Inability to focus. Phil cannot pay attention well enough to follow the conversation or to remember his commitment to use the Core Concerns System.

Mindfulness should help Phil continue to pay attention to what is going on in the negotiation, rather than getting distracted. It also should help him remember his commitment to use the Core Concerns System (his “Espoused Theory”), to notice when he abandons it in favor of a different “Theory-in-Action,” and then to return to it. Thus, if he tells Jack that he is “a lazy bum and deserves no role in the business,” mindfulness can help him notice that he is not being faithful to his intention. This gives him an opportunity to reconsider his behavior—and his decision to employ the Core Concerns System in this negotiation.

A Specific Incident in the Negotiation

Phil would have the least trouble working with the Core Concerns System in preparing for and reviewing the negotiation because, although any of the obstacles described above might arise, physical separation from Jack provides a space that could

---

160 See Freshman, External Mindfulness, supra note 133; Freshman, Yes, and, supra note 42.
161 See supra notes 77-79 and accompanying text.
allow Phil to assume an appropriate state of mind. In addition, he can bring mindful awareness to these efforts. He may already be in a mindful state. And he may deliberately induce—or strengthen—this state by formal mindfulness or loving-kindness meditation or an informal method.

While actually conducting the negotiation, however, Phil could face his greatest challenges to applying the Core Concerns System. Even if he uses the Core Concerns System to prepare for the negotiation, Phil would face a risk that, during the negotiation, Jack would “push his buttons” or otherwise do something that knocks him off balance. For instance, Jack might express negative emotions and judgments toward Phil, through gestures or through statements such as those set forth in Part II. If Phil were able to use the Core Concerns System appropriately, he might be able to avoid a deterioration in the relationship and handle the situation so as to produce positive emotions.

For the sake of simplicity, in analyzing this situation, I will focus on the third obstacle—automatic, habitual ways of thinking, feeling, and behaving.

In the situation I described previously, Phil makes a proposal, and immediately picks up a carafe of coffee to fill Jack’s cup. Jack responds quickly, calling Phil a “pompous, self-satisfied, arrogant jerk” and casting aspersions on Phil’s competence and his devotion to the firm. At that point, Phil likely would experience developments on all

---

162 See supra, notes 134-36 and accompanying text.
163 See supra, text following note 104.
164 See supra, text following note 51.
165 In some sense, this obstacle to appropriately using the Core Concerns System may embrace all the other obstacles, and the means of addressing this obstacle—non-judgmental awareness of thoughts, emotions, and body sensations—constitutes mindfulness itself. See supra, Figure 4. How Mindfulness Can Help Address Obstacles to Using the Core Concerns System.
three interacting dimensions of the triangle of awareness\textsuperscript{166}: thoughts, emotions, and body sensations.

**Thoughts:** Phil’s reaction or response would depend largely on his thinking—how he interprets or appraises Jack’s behavior. Negative thoughts about Jack, such as the following, might arise: “What a rotten, bumbling fool! And he’s completely \textit{wrong}, I fully understand marketing and sales and I’ve always supported him. I’m not \textit{pompous}, I am \textit{competent}.” Phil also might have negative thoughts about himself: “Maybe Jack is right. Perhaps I’ve always stayed in the office because I think I’m too good to go on the road as a salesman. Maybe I’m a \textit{fraud}.”

**Emotions:** Negative thoughts of this nature about Jack could precipitate negative emotions, such as anger or hatred, and reactive behaviors, such as retaliation. Negative thoughts about himself could trigger self-hatred or despair and perhaps prompt Phil to withdraw from discussions with Jack. Phil might thereby lose his balance through suffering an “identity quake,” which Bruce Patton, and Sheila Heen tell us, arises from an internal “identity conversation” that struggles with the questions “Am I competent?”, “Am I a good person?”, and “Am I worthy of love?”\textsuperscript{167}

**Body sensations:** Negative emotions (and positive emotions) arise in combination with physical sensations. For instance, anger and hatred might be associated with tension in

\footnotesize\textsuperscript{166}See supra, Figure 3. The Triangle of Awareness and notes 139-41 and accompanying text.\textsuperscript{167}It is what this conversation seems to be saying about us that rips the ground from beneath our feet. Getting knocked off balance can even cause you to react physically in ways that make the conversation go from difficult to impossible. Images of yourself or of the future are hardwired to your adrenal response, and shaking them up can cause an unmanageable rush of anxiety or anger, or an intense desire to get away. Well-being is replaced with depression, hope with hopelessness, efficacy with fear. And all the while you’re trying to engage in the extremely delicate task of communicating clearly and effectively.\textsuperscript{STONE ET AL., supra note 9, at 113.}
certain muscles (e.g. in the neck or hands), increased heart rate, and puffing of the chest. Likewise, energy depletion and a slumping posture might accompany despair or self-hatred.

I have shown how negative thoughts can precipitate negative emotions, which in turn can produce unpleasant body sensations. Of course, all three of these elements can interact, in many ways. The negative emotions, for example, prompt more negative thoughts, and the negative thoughts can produce still more, or stronger, negative emotions. Unpleasant body sensations also can produce more negative thoughts and emotions. In this way, the three elements of the triangle of awareness can combine to escalate tension and self-centeredness in Phil.

Fortunately, a state of mindful awareness can interrupt the escalation of the thoughts-sensations-emotions-behavior cycle. Here, it could heighten Phil’s ability to attend to these thoughts, emotions, and body sensations as if at a distance, with some equanimity. In other words, he could observe the three elements of the triangle as “objects” rather than as part of himself; he may observe his emotions as “just emotions,” the sensations as “just sensations,” the thoughts as “just thoughts” (and therefore subject to the currently popular saying, “Don’t believe everything you think”). From such a perspective, he could simply “let them be” Or he might chose to observe or examine these phenomena more carefully. He might, for instance, examine these thoughts and to decide whether they were true or significant and whether to act upon them. He might look for the causes of the emotions, e.g., in his own core concerns. He might be able to observe his behavioral impulses or intentions and consider whether they would achieve his objectives. In this way, he secures a degree of freedom from his habitual, automatic thoughts,
emotions, and behaviors, a freedom that would enable him to respond skillfully to Jack (which, in our hypothetical, means using the Core Concerns System, rather than reacting reflexively). For instance, Phil could “express appreciation” in a way that Jack could perceive as genuine.  

Figure 5 illustrates the process I have just outlined.

Figure 5. Internal States and Behavior in Negotiation

---

168 Recall that, in this hypothetical, using the Core Concerns System would include figuring out which core concerns had precipitated Jack’s angry statement and trying to address them. If Phil gains such insights, they could undercut or weaken his assumption that Jack was a “mean jerk.” Stone, Patton, and Heen describe a similar process when they recommend that you “negotiate with your feelings”:

What does it mean to negotiate with our feelings? Fundamentally, it involves a recognition that our feelings are formed in response to our thoughts. Imagine that while scuba diving, you suddenly see a shark glide into view. Your heart starts to pound and your anxiety skyrockets. You’re terrified . . . .

Now imagine that your marine biology training enables you to identify it as a Reef Shark, which you know doesn’t prey on anything as large as you. Your anxiety disappears. Instead you feel excited and curious to observe the shark’s behavior. It isn’t the shark that’s changed; it’s the story you tell yourself about what’s happening. In any given situation our feelings follow our thoughts.

This means that the route to changing your feelings is through altering your thinking.

STONE ET AL., supra note 9, at 100.

In this situation, Phil’s realization that Jack’s angry outburst was precipitated by Jack’s Appreciation and Autonomy core concerns probably would undercut or weaken Phil’s assumption that Jack is a bad person, or a “jerk,” which likely resulted from what psychologists call the “fundamental attribution error.” See supra notes 54, 73 and accompanying text.
If Phil has practiced mindfulness sufficiently, it may have become enough of a trait—or he may have developed enough skill at remembering to be mindful—that he will be in a mindful state when Jack makes his negative comment. If he is not in such a state, he may nonetheless recall a technique for inducing it. One such method is the so-called “STOP” exercise, also developed by the Stress Reduction Clinic at the University of Massachusetts Medical School:

Stop
Take a breath
Open your awareness to body sensations, thoughts and emotions (the Triangle of Awareness)
Proceed.\textsuperscript{169}

With practice, Phil could learn to employ it in a way that no one would notice.

In Part IV, I have explained how mindfulness can make it easier for a negotiator to use the Core Concerns System. Next, in Part V, I speculate about other ways in which mindfulness and the Core Concerns System can interact, focusing primarily on how the Core Concerns System can reinforce mindfulness.

\textbf{V. How the Core Concerns System Can Reinforce Mindfulness}

Just as mindfulness can help one use, and want to use, the Core Concerns System, the Core Concerns System can enhance a negotiator’s mindfulness. Several of the obstacles to using the Core Concerns System that I identified above—particularly, excessively self-centered perspectives; strong negative emotions; automatic, habitual ways of thinking, feeling and behaving; and inadequate focus--also threaten our ability to develop or sustain mindful awareness. If one is sufficiently mindful and skillful, one can essentially disarm, deflect, or disregard these threats--by treating them simply as objects of awareness.

Sometimes, however, such phenomena are too strong or too fast for one’s skill level. This same difficulty can arise in other realms of activity. For instance, I once jokingly asked a very gifted martial arts instructor (I will call him Todd), whether he could “take Arnold Schwartzenegger.” Todd, who stands 5’7” and weighs about 140 pounds, replied, in all seriousness, that he could “easily” take Schwarzenegger, and that his first

\textsuperscript{169} This technique was developed in the Stress Reduction Clinic at the University of Massachusetts Medical School. A longer version appears as the “3-Minute Breathing Space” in SEGAL ET AL., COGNITIVE THERAPY, \textit{supra} note 90, at 173. Scott Rogers, Director of the Institute for Mindfulness Studies, has created a series of exercises, based on using the hands, to develop present moment mindful awareness. \textit{See} SCOTT ROGERS, MINDFULNESS FOR LAW STUDENTS: USING THE POWER OF MINDFUL AWARENESS TO ACHIEVE BALANCE AND SUCCESS IN LAW SCHOOL 92-94 (2009); SCOTT L. ROGERS, THE SIX-MINUTE SOLUTION: A MINDFULNESS PRIMER FOR LAWYERS 82-84 (2009).
concern would be “to avoid hurting him.” Then he paused and added, “Unless
Schwartzenegger managed to get his arms around me. His grip might be too strong for me
to escape.”170 Similarly, in specific circumstances, one or more potential threats to
mindfulness might be too strong for a person to overcome it. Just as specific martial arts
skills might help Todd avoid Schwartzenegger’s grip, and other skills (such as those of
more advanced martial arts masters) might help him escape, knowledge of the Core
Concerns System—and skill in deploying it—could help a negotiator deflect or disarm or
disregard these obstacles and maintain mindfulness.

Challenges to mindful awareness (and the kindliness and equanimity that are
essential aspects of it) confront not only novices, like Phil, but also experienced
practitioners. Several years ago, for instance, a member of a group of mindfulness and
loving-kindness meditation teachers proposed that the group gather the night before an
important election to send loving-kindness171 to a candidate toward whom they all felt
hostility. Most of them said that they “just could not” do that, even while recognizing the
irony inherent in an expression of that view by person who teaches loving-kindness
meditation.172 I assume that they felt overwhelmed by negative thoughts and emotions

---

170 When I asked Todd to review this statement, he responded as follows:
I think it's fine to use as it is, especially since it illustrates your point. Nevertheless, allow
me to amend my statement. If the Governor, or any large guy, were to get his arms around
me, his grip might be too strong for me to escape WITHOUT hurting him badly. I could
still escape, but because of his extreme strength, I might need to resort to more devastating
(or even deadly) techniques.

But I think that your analogy still holds. In the world of high-level martial arts, it is
understood that, no matter what your skill level, there is always someone (or something) at
a higher level. By constantly raising your skill level, you lower your chances of
encountering something that can overwhelm you. But the learning curve is asymptotic—you
can never reach a level of invulnerability.

Email message from “Todd”, a martial arts instructor, to Leonard Riskin (Oct. 4, 2009).
171 See supra notes 134, 136 and accompanying text.
172 There are at least two ironic aspects of this situation: 1. Teachers of loving-kindness provide their
students with techniques for developing their ability to send loving-kindness to persons they dislike; and 2. If
about the politician. I suspect that this occurred partly because they did not consider the causes of the behaviors that they so distained. Awareness of the core concerns framework—in that moment—could have made it more likely that they would have recognized some such causes. This might have reduced their hostility and even generated compassion for the politician, and allowed them to recognize that, if these good wishes manifested in this politician, perhaps he would not engage in the kinds of behaviors to which they objected. In addition, knowledge of the candidate’s core concerns, could have enhanced their interest in him, enabling them to sustain their focus on him, in much the same way that taking a course in herpetology might help me carefully watch that alligator near the path where I walk in the Paynes Prairie Preserve—rather than running away at top speed.

Knowledge of the Core Concerns System might have helped for another reason: Some of these meditation teachers’ own core concerns could have played a role in their declarations of unwillingness to act as suggested. For instance (and this is pure speculation for the sake of illustration), they might have worried—consciously or subconsciously—about whether their willingness to send loving-kindness to this politician could diminish the extent to which other members of the group Appreciated them, or whether it would

the “enemy” actually reaped the benefits of such good wishes—traditionally, safety, happiness, health, and peace of mind (see Salzberg, supra note 88, at 30) they would be less likely to behave in ways that cause harm to others.

Many practitioners of loving-kindness meditation have difficulty sending good wishes toward persons whom they dislike. See Salzberg, supra note 90, at 79-80.

Paynes Prairie Preserve State Park is a wildlife preserve near Gainesville, Florida, and host to many, many alligators. See http://www.floridastateparks.org/paynesprairie/. Of course, knowledge of the core concerns while negotiating, like knowledge of herpetology in Paynes Prairie, also affects what one sees. See Mark Twain, Life on the Mississippi [Ch. 8, (1883)] as reprinted in JAMES B. WHITE, THE LEGAL IMAGINATION 10-12 (explaining how knowledge of the Mississippi River that Twain acquired as a river boat pilot affected his perceptions of the river).
weaken the bonds of Affiliation.\textsuperscript{175} Other core concerns also might have affected their perceptions and behavior, too. If they could have recognized the presence of their own core concerns, they might be able to treat them mindfully, and decide whether and how to address them. Such understanding should reduce the dominance of these core concerns and allow for the possibility of less attention to self, which automatically means more attention to the politician, which should make it easier for them to send good wishes to him.

As this example shows, habitual thoughts, emotions, bodily sensations, the behaviors they produce, can be both causes and manifestations of core concerns. For that reason, awareness of one’s own core concerns can help bring these phenomena into bolder relief, thus making it easier to treat them mindfully and gain some distance from them.

In a similar fashion, knowledge of the Core Concerns System can help a negotiator, such as Phil, maintain mindful awareness. When Jack makes a nasty comment, Phil’s knowledge of the Core Concerns System could help him realize that Jack’s statement was motivated by Jack’s core concerns for appreciation and affiliation. Such a realization should reduce Phil’s anger toward Jack, as I have explained above; this is the same anger that might have derailed Phil’s mindful awareness. Similarly, as Phil becomes more aware that his own core concern for appreciation is sparking anger toward Jack, this anger diminishes. As Deborah Calloway puts it, “Emotions explode into confrontation because people are blind to the pathways that lead to strong emotions. . . . By working with our \textit{own} emotions, we can learn not to identify with our clients’ emotional reactions. Seeing our \textit{own} hidden pathways makes it possible to see what is happening when others react

\textsuperscript{175} Most devoted practitioners would consider it a sign of spiritual maturity to be able to send lovingkindness in such a situation. They also would recognize that if the recipient actually had the good things you wished for him he likely would not done the kinds of acts to which you object.
emotionally."\textsuperscript{176} Such insights about Jack could further soften Phil’s focus on himself, which allows for a greater focus on and compassion for Jack to arise.\textsuperscript{177} Knowledge of the core concerns also makes Jack seem more interesting to Phil (just as alligators seem more interesting to the herpetology student), which makes it easier for Phil to maintain a focus on Jack, which in turn further reduces his focus on self. Phil’s ability to recognize the role of certain of his own core concerns could also help him notice that habitual thoughts, emotions, and behaviors that are associated with the core concerns—both as causes and manifestations; such insights could give him an additional distance from these phenomena, which enhances mindfulness.

In these ways, the Core Concerns System could help Phil maintain mindful awareness by helping him address challenges to it, such as excessively self-centered perspectives; strong negative emotions; habitual thoughts, emotions, and behaviors; insensitivity to emotions, and inability to focus.

Conclusion

Having said all that, I can condense it as follows: Fisher and Shapiro tell us, and I generally agree, that negative emotions can interfere with good interest-based negotiation. (I think they also can interfere with good adversarial negotiation.) Fortunately, the Core Concerns System can sometimes help a negotiator understand and address the causes of some negative emotions and promote positive emotions, thereby enhancing the prospects for interest-based negotiation. But here is the problem: Not infrequently, negotiators who have mastered the Core Concerns System, and intend and prepare to use it in a particular negotiation, fail to do so; sometimes, looking back, they wish that they had used the Core

\textsuperscript{177} See supra Sec. IV.D.1.a.
Concerns System because they believe it would have produced a better process and outcome. When this happens, it typically results from deficiencies in present-moment awareness. Mindfulness can remedy these deficiencies in awareness and thereby help a negotiator carry out the Core Concerns System appropriately. Reciprocally, the Core Concerns System can help a person maintain mindfulness. Through such mutual reinforcement, mindfulness and the Core Concerns System could do more together than they could separately to reduce self-centered thoughts, emotions, and behaviors and encourage more other-centered thoughts, emotions, and behaviors.

Beyond all that, I believe that such developments are likely to promote more ethical negotiation behavior. This is a complex issue, however, especially in connection with negotiations conducted by lawyers or other agents, and I intend to devote more attention to it in future writing.

---

---
I close with some reservations and qualifications.

First, the explanations and proposals I offer are highly theoretical. In addition, they rest on simplified fact patterns and simplifying assumptions about human interaction and behavior and negotiation theory. Thus, much of the discussion in this article addresses the ways in which the core concerns and mindfulness can help a negotiator skillfully use interest-based negotiation. I adopted that focus because that is the thrust of Beyond Reason. However, in real life, most negotiations contain both interest-based and position-based elements, and negotiators need to be aware of the tension between them.¹⁷⁹ And argued that mindfulness would tend to incline lawyer-negotiators and mediators to follow both kinds of rules, relying in part on the concern for others that mindfulness tends to develop.

Several qualities or outcomes of mindfulness increase the likelihood that the mediator, lawyer, or negotiator will choose not to violate the minimal standard. First, through mindfulness, we become more aware of our own thought processes and the intentions behind our acts. We more easily notice the habitual self-centered thoughts and the emotions, body sensations, and behaviors they precipitate. When we observe these phenomena at a psychological distance, their strength or power or influence tends to diminish, and we have a chance to consider their merit. Mindfulness allows us to insert a “wedge of awareness” before we act. In particular, mindfulness helps us notice the intentions that impel our behavior. When we consider or form an intention to behave in a way that would unduly benefit ourselves at the expense of another (e.g., to lie about a material fact to a negotiation counterpart), if we are mindful we . . . might observe cautionary thoughts that flash through our minds, such as the realization that we are violating an ethical precept or that the contemplated act would cause suffering in others (and in ourselves) . . . And the calm associated with mindfulness enhances our ability to reflect on the intention and associated warning signals.

Second, mindfulness helps us see interconnections with others. Mindful awareness allows us to more easily observe our own suffering, which helps us be aware of the suffering of others . . . And often such awareness produces compassion, and a desire to reduce suffering in ourselves and others.

Id. at 498-500.

In this Symposium, Professor Ellen Waldman has expressed reservations about the potential impact of mindfulness in fostering ethical behavior in negotiation. See Ellen A. Waldman, Mindfulness, Emotions, and Ethics: The Right Stuff?, 10 NEVADA L.J. ___, ___, ___ (2010). (Arguing that we should have modest expectations about its potential contributions.). Professor Katherine Kruse seems to share my appreciation of the potential value of mindfulness in fostering ethical behavior, and recommends that I connect mindfulness with a larger theory of justice in dispute resolution. See Katherine R. Kruse, Lawyers in Character and Lawyers in Role, 10 NEVADA L.J. ___, ___ (2010), and Professor Ran Kuttner has raised deeper questions about sources of ethical behavior and illustrated the potential that mindfulness holds for cultivating “wisdom” in the Buddhist sense of the term. See Ran Kuttner, What does it Mean to Do the Right Thing?, 10 NEVADA L.J. __ (2010). Had I the time, I would have responded to each and incorporated many more of their insights.

¹⁷⁹ See LAX & SEBENIUS, supra note 8, at 33-35.
both the Core Concerns System and mindfulness—alone or together—can help a negotiator carry out position-based or distributive strategies and tactics by enhancing awareness and an ability to maintain balance and focus.

Second, I have described the potential benefits of mindful awareness in negotiation with little attention to the immense difficulties of actually developing and sustaining it. Practicing mindfulness meditation does not guarantee the development of mindful awareness, either “on the cushion” or in daily life. Indeed, cultivating and sustaining mindfulness has much in common with cultivating and sustaining other skills, such as performing a root canal or playing the flugelhorn or hacky-sack. Nearly everyone knows the joke about the tourist in New York City who stops a local on the street and asks, “How do I get to Carnegie Hall?” The New Yorker replies, “Practice.” Similarly, for most people, enormous amounts of practice, are necessary, but sometimes not sufficient, to developing and maintaining the attentional skills that form the basis of mindfulness. In addition, being mindful requires more than meditation practice. It also helps to show kindness and compassion toward others, live a moral life,\(^\text{180}\) eat well, and get a good night’s sleep. Even with all that, there will be times when a negotiator’s present moment mindful awareness, especially the equanimity aspect, will vanish. Pir Vilayat Khan, leader of the Sufi Order in the West,\(^\text{181}\) made a similar point when he said: “Of so many great teachers I’ve met in India and Asia, if you were to bring them to America, get them a house, two cars, a spouse, three kids, a job, insurance, and taxes . . . they would all have a

\(^{180}\) One way to understand this is through the idea of the Noble Eight-Fold Path set forth by the Buddha as a way to end the suffering associated with craving and delusion: Right View, Right Thought, Right Speech, Right Action, Right Action, Right Livelihood, Right Mindfulness, and Right Concentration. See Flickstein, supra note 108 at 113-43 (2001); for a contemporary rendering of the Buddha’s original explanation of these ideas, see the Mahasattipassana Sutta, supra note 108.

\(^{181}\) Sufism is a mystical branch of Islam. See generally, Idries Shah, The Sufis (1964).
Still—and this is my main point—extensive and sustained mindfulness practice can increase the proportion of time when we can behave skillfully, in the same way that practice improves Albert Pujols’ batting average. And even if one fails to negotiate skillfully because of a loss of mindfulness, once mindfulness returns, it can incline the negotiator to clean up the mess.

Third, and last, both mindfulness and the Core Concerns System—and their interactions—offer more profound possibilities than those I have discussed. Some of the commentators in this Symposium have elaborated or revealed glimpses of such possibilities. I wish I had time to bring all such insights into this article. I believe, however, that mindfulness and the core concerns have the potential to bring people together in ways that I cannot express in words. Rumi points in the right direction:

Out beyond ideas of wrongdoing and right doing,
there is a field. I’ll meet you there.
When the soul lies down in that grass,
the world is too full to talk about.
Ideas, language, even the phrase each other
doesn’t make sense.
